

ABSTRACT

Provided in the present disclosure are a relay UE handover method and apparatus, and a communication device and a readable storage medium, which are applied to the terminal field of wireless communications. The relay UE handover method comprises: on the basis of a serving cell of a target relay UE, determining whether to hand over to the target relay UE. In the present disclosure, when a remote UE learns that same is required to hand over to a target relay UE, it is determined, on the basis of a serving cell of a remote target relay UE, whether to hand over to the target relay UE. That is to say, the serving cell of the target relay UE is taken as a reference parameter for handover. Therefore, the failure of remote UE handover caused by changing of the serving cell of the relay UE can be avoided, thereby improving the stability of a wireless communication system.
