Abstract

Method, adapter card and arrangement for the installation of memory modules

5

Memory modules (2) without signal-conditioning means (unbuffered, unregistered) are provided in a system by means of adapter cards (4) which have signal-conditioning devices (41) and are then operated in the
10 manner of memory modules (2) with signal-conditioning means (buffered, registered), whereby systems can be expanded in a very simple manner and can be flexibly adapted according to requirements, and for which purpose only one type (unbuffered, unregistered) of
15 memory modules (2) is required.
