

[Title of Invention]

Disposable Diaper

[ABSTRACT]

In the disposable diaper (1), outside in the product widthwise direction (W) with respect to a position of a maximum width (Wmax1/Wmax2) of the absorber (2C), at least one pair of leg-hole elastic members (3) are arranged which are stretchable in the product longitudinal direction (L); inside in the product widthwise direction (W) with respect to the pair of leg-hole elastic members (3) and outside in the product widthwise direction (W) with respect to the position of the maximum width (Wmax1/Wmax2) of the absorber (2C), at least one pair of inner elastic members (4) are arranged which are stretchable in the product longitudinal direction (L); at the ventral side (F), the constriction unit (2C1) reaches an outer side in the product longitudinal direction (L) with respect to a range (R1) in an effective length of the leg-hole elastic member (3); and in the product longitudinal direction (L), an end edge (E1) at the ventral side (F) in the effective length of the inner elastic member (4) exists within a range (R2) in which the constriction unit (2C1) is arranged.
