

METHOD FOR SELECTIVE NOISE SUPPRESSION IN AN AUDIO PLAYBACK

ABSTRACT

A method for selective noise suppression in an audio playback is provided. The method includes providing a processor, obtaining a microphone state and a playback device state with the processor from an operating system, determining the audio playback is communication audio based on the microphone state and the playback device state, and enabling applying noise suppression to the audio playback if the audio playback is communication audio, is not music and noise is present, or otherwise disabling applying noise suppression to the audio playback.
