POLYPEPTIDE AND USE THEREOF IN CONSTRUCTION OF BISPECIFIC ANTIBODY CONTAINING COMMON LIGHT CHAIN

Abstract

A polypeptide derived from a light chain variable region or a light chain of a specific anti-c-Met humanized antibody. The polypeptide can be used as a common light chain of a bispecific antibody, together with the heavy chain variable region or heavy chain of an antibody having a binding affinity and/or specificity to other target proteins (such as, EGFR), to construct the bispecific antibody. An anti-EGFR and/or c-Met antibody, the antibody containing a common light chain variable region or light chain.
