(54) Title: COVERING DEVICE WHICH CAN BE COMBINED WITH AN ELECTRIC MODULE

(57) Abstract: Covering device which can be removably connected to an electric module, comprising a body and an engagement system. The body includes a lower surface suitable for interfacing with the module, and comprising two transverse sides, two longitudinal sides and four vertices. The engagement system includes engagement elements which are arranged near each vertex of the body. Each engagement element comprises: an engagement portion, a support portion and a receiving member. The engagement portion comprises a first surface which is located in a plane substantially parallel with the lower surface of the body of the covering device, the first surface comprising an oblique side which is inclined with respect to a longitudinal axis of the lower surface. The support portion extends between the lower surface of the body and the engagement portion. The receiving member is delimited by the engagement portion, the support portion and the lower surface and is formed so as to allow insertion of a connecting element of a respective connection device of the electric module.
