

ABSTRACT**BOTTOM FOR BED APPARATUS**

Provided is a bottom for a bed device that is comfortable for the user when lying on the bed device. In a rising bottom provided in the upper part of the bed device, the bottom has a bottom for the back, a bottom for the hips, a bottom for the knees, and a bottom for the feet, each part comprising a thick panel made of resin, required parts from among these parts being constituted so as to be linked together by linking parts. The linking parts are integrally formed of the same material as the required parts, but are thinner than the required parts. Recessed portions are formed in the bottom on the upper surface thereof, the recessed portions being formed in a widthwise center part of the bottom, and a plurality of through-holes passing from the front surface to the back surface of the bottom are formed at locations where the recessed portions are formed.
