Abstract

The invention concerns a diagnostic test unit for analysing a body fluid comprising a test carrier (test tape 10; test strips 12) provided with test fields (38) for applying the body fluid and a container (14) containing the test carrier, wherein an opening (18) of the container (14) is at least in some areas bordered by a seal (16). According to the invention it is proposed that the opening (18) is screened by a closing foil (22) from the surroundings of the container (14) and that the test tape (10) or a test strip (12) to be dispensed is passed through a passage gap (20) between the closing foil (22) and the seal (16).
