Title of Invention: Method and System for Determining a Priority Level of a Road

Abstract

The present disclosure provides methods and systems for determining a priority level of a road. In some examples, there is provided a method comprising: determining, by a processor, a position associated with a road relative to one or more roads based on a total number of one or more vehicles that travelled on the road and a speed of the one or more vehicles on the road; and determining, by the processor, a priority level of the road based on whether a position associated with a priority level relative to one or more priority levels for the one or more roads matches the position associated with the road.
