

ADHESIVE SHEET, BLOOD BAG WITH ADHESIVE SHEET, AND METHOD
FOR PRODUCING SAME

Abstract

An adhesive sheet comprising a sheet-like base
5 material and a heat-sensitive adhesive layer is provided as
an adhesive sheet which can be appropriately adhered to a
plasticized vinyl chloride resin article as an adherend
even if the heat-sealing is performed at a low temperature
and in which the lifting or delamination of the adhesive
10 sheet and the flowing out of the adhesive from an end
portion of the adhesive sheet are suppressed even if an
autoclave treatment is performed for the above article to
which the sheet is adhered. The heat-sensitive adhesive
layer is formed using a heat-sensitive adhesive composition
15 that contains a polyester-based resin and a crosslinking
agent, and the heat-sensitive adhesive layer includes a
cross-linked structure that is based on these components.
The polyester-based resin contains an amorphous polyester
resin having a glass transition temperature of -30°C or
20 higher and 7°C or lower in an amount of 80 mass% or more
relative to the whole polyester-based resin.
