

ABSTRACT

There is provided a massager (1) comprising a massaging mechanism (2) which is small and compact, yet performs effective massage on a treatment site ranging from thigh backside (B) through buttocks (T) of a user (U), and can be securely stored within the massager (1) without causing a massaging element (9), etc. to protrude out of the massager (1).

The massager (1) comprises: the massaging mechanism (2) to massage the treatment site, including at least the buttocks (T) of the user (U); and a seat dimensioned to be wide enough for seating of the user (U), and including a support frame (3) to house the massaging mechanism (2). The massaging mechanism (2) applies pressure massage to the treatment site from below upward while traveling in a front-rear direction.
