(54) Title: BICYCLE SADDLE

FIG. 1

(57) Abstract: The finding concerns a bicycle saddle, which is of a type sim-
ilar to the saddle described in documents EP 1 590 229 and EP 1 781 528, of
the type that has two identical portions (30, 31) arranged symmetrically with
respect to its longitudinal axis; at said longitudinal axis there is, in particular,
a channel (15) that is open from top to bottom. Such a saddle, at the front,
when seen from the side, takes up a bird's beak configuration. Said saddle is
characterized in that the two portions (30, 31), at their rear ends, until they
reach the extensions (9, 10) that face the central channel, have substantially
flat areas (1, 2) (on which the gluteal muscles of the user are intended to sit
during the use of the saddle) which are substantially parallel to the ground on
which the wheels of the bicycle rest.
