

DOWNLINK TRANSMISSION METHOD AND APPARATUS

ABSTRACT

Embodiments of this application provide a transmission method and apparatus. The method includes: A first network device generates first information, where the first information indicates
5 at least one codebook and a weighting coefficient matrix corresponding to the at least one codebook, and the at least one codebook and a weighting coefficient corresponding to the at least one codebook are used to determine a first beamforming matrix; and the first network device sends the first information to a second network device. Based on this application, the first network device sends the first information to the second network device instead of sending a beamforming matrix,
10 so that an amount of data sent by the first network device to the second network device can be reduced.
