(54) Title: APPARATUS FOR OPERATING SYRINGE PISTON

(57) Abstract: Disclosed is an apparatus for operating a syringe piston. The apparatus includes a syringe mounting section for fixedly mounting a syringe, in which a screw hole is formed at an upper head part of the syringe mounting section, and a piston press unit having a screw bar, which is screw-coupled into the screw hole so that the syringe piston press unit is movable up and down along the screw hole, wherein the piston press unit presses a syringe piston with a constant pressure such that a predetermined amount of contents is precisely injected into a human body from the syringe. The syringe filled with medical cement is attached to the syringe mounting section and the syringe piston is moved downward without moving upward when the user rotates the piston press unit having the screw bar, so medical cement contained in the syringe is extruded from the syringe with a constant pressure, so that a predetermined amount of medical cement is precisely injected into a human body. Thus, the apparatus significantly improves quality and reliability of products, thereby providing consumers with high satisfaction and a good impression.
