HANGING MECHANISM

Abstract

In order to facilitate horizontally hanging an object, a hanging mechanism includes: a first hanging shaft to be hung from a ceiling; a second hanging shaft supported so as to be hung from the first hanging shaft; and a connecting section connecting the first hanging shaft and the second hanging shaft. The connecting section includes: a protruding spherical surface of a first connecting member that is provided on the first hanging shaft side; and a recessed surface portion, which is a recessed spherical surface of a second connecting member that is provided on the second hanging shaft side and that is in contact with the spherical surface of the first connecting member.
