Learning Management System

ABSTRACT OF THE DISCLOSURE

A learning management system comprises a system end, a first communication device, and at least a second communication device. The system end includes an instruction generating unit and a barcode generating unit. The instruction generating unit is utilized for inputting a teaching instruction. The barcode generating unit is electrically connected to the instruction generating unit and is utilized for generating a 2D barcode according to the teaching instruction. The first communication device is communicated with the system end through a network and is utilized for inputting the teaching instruction by a teacher. The second communication device includes an accessing module. The second communication device is communicated with the system end through the network and is utilized for using by at least a student. The accessing module is utilized for accessing the 2D barcode. The student assesses the 2D barcode through the accessing module to perform the teaching instruction.
