

1. Correction of the tape-counting device of a recorder.
- 2.1. In the case of machines for recording and/or playing back information, such as for example video recorders, it is known to mark within a recording certain sections or scenes which can then be specifically sought or specifically wound to by controlling with the tape-counting device of the machine. However, in the event of counting errors of the tape-counting device, for example after repeated winding operations of the recording medium, tape locations corresponding to the markings cannot be found.
- 2.2. According to the invention, chosen recording sections are selectively wound to from a reference marking (3) by means of the tape-counting device and correspondingly stored tape counter reading values.
- 2.3. In particular a video recorder.
