

ABSTRACT

5 Silver crystal unit (15) in the present disclosure includes first opening (20) that
encloses water-soluble silver crystal (29), is configured to be attachable to a washing
machine, and through which water is introduced into silver crystal unit (15), and second
opening (21) through which water is drained from silver crystal unit (15), and first opening
(20) and/or second opening (21) are provided with water passing member (27) having a
10 mesh shape. As a result, even silver crystals (29) each having a small particle size can be
prevented from leaking from the second opening. Therefore, silver crystals (29) each
having a small particle size easily dissolve in water, and accordingly, a high auxiliary
action can be obtained even with a small amount of silver crystals (29).
