

Abstract

The invention relates to a regulating valve (1), which is attachable, in particular in a bore (40) of a hydraulic door closer (11), executed with a female thread (41), which
5 valve has a body (2), adjoined by a regulating area (3), and a thread (6) provided with an anti-rotation means, the thread (6), including the anti-rotation means, being screwed into the female thread (41) of the bore (40). In order to provide a regulating valve (1) which has a simple
10 design while excluding unwanted adjustment of the regulating valve (1) during the operation, it is proposed that the anti-rotation means present a raised area (7) which cooperates with the bore (40) or the female thread (41) of the door closer (11).
