(54) Title: INHALATION DEVICE

(57) Abstract

An inhalation device for inhalation of a pharmaceutically active substance comprising means for generating a negative pressure or vacuum and means for housing an inhaler within said device, said device comprising a constant volume and a variable volume in fluid connection with each other, said negative pressure or vacuum being generated in the constant volume through the variation of the volume in the variable volume whereby the substance is moved from said inhaler and dispersed in said constant volume, a flow regulating valve for regulating the flow of substance to the constant volume and a channelled region surrounding an outlet in said contant volume to prevent substance leaving said outlet when not in a dispersed state.
