VIDEO INFORMATION DISTRIBUTING AND DISPLAYING SYSTEM AND VIDEO INFORMATION DISTRIBUTING AND DISPLAYING METHOD

ABSTRACT

A screen creating unit selects component contents K2 to K19 for displaying a station name array, in which a plurality of station names on a route are arrayed in order of arrival, from a component-content storing unit, moves, according to component arrangement definition data and component motion definition data, the component contents little by little in an array direction from a state in which only a part of station names on a starting station side among the station names are arranged in a scroll display region to a state in which only a part of station names on a terminal station side are arranged, and creates an image of only a portion in the scroll display region without creating the image of a portion outside the scroll display region among the component contents K2 to K19 to thereby create a plurality of frames continuous in time series.
