

METHOD FOR DEVICE TO ACCESS NETWORK, ACCESS POINT, NETWORK ACCESS DEVICE, AND SYSTEM

ABSTRACT

Embodiments of the present invention disclose a method for a device to access a network, an
5 access point, a network access device, and a system. The method includes: generating, by an access
point, a broadcast frame, where the broadcast frame includes feature information of a network
access device; and the feature information is used for indicating a feature of the network access
device; and broadcasting, by the access point, the broadcast frame, so that a specific network access
device initiates a network access procedure to the access point; where the specific network access
10 device is a network access device which receives the broadcast frame and has the feature indicated
by the feature information. By adopting the present invention, contention collisions among network
access devices can be reduced through a manner of accessing a network in batches.
