

ORDER MANAGEMENT METHOD AND SYSTEM, ELECTRONIC DEVICE, AND STORAGE MEDIUM

ABSTRACT

Embodiments of this specification provide an order management method and system, an
5 electronic device, and a storage medium. The method includes: determining a current connection
status between a local server and a remote server in response to receiving order information of an
offline order from a POS device, where the offline order is an order generated by an operator by
using the POS device; determining, based on the current connection status, at least one candidate
payment method applicable to the offline order from a payment method set supported by the order
10 management system, and sending the at least one candidate payment method to the POS device, so
that the POS device initiates a payment procedure of the offline order based on the at least one
candidate payment method; and sending the order information of the offline order to the remote
server, so that the remote server stores the order information.
