

POSITIONING INFORMATION TRANSMISSION METHOD AND APPARATUS

ABSTRACT

This application provides a positioning information transmission method and apparatus, and relates to the field of wireless communication technologies, to improve positioning accuracy. In the method, a terminal device may receive first information from a network device. The first information may be used to request capability information of the terminal device. The terminal device may send first capability information to the network device. The first capability information may include capability information of sending a reference signal by the terminal device based on a first bandwidth. The first bandwidth herein is greater than a second bandwidth, the first bandwidth may be used by the terminal device to send the reference signal, and the second bandwidth may be used by the terminal device to receive and/or send communication data. Based on the solution, the terminal device has a capability of sending a reference signal on the first bandwidth. Because the first bandwidth is greater than the second bandwidth, the terminal device may send the reference signal based on the larger bandwidth, so that positioning accuracy of the terminal device can be improved.
