(54) Title: SYNCHRONIZATION FOR A-IOT DEVICE

FIG. 6

(57) Abstract: Various aspects of the present disclosure relate to synchronization for an A-IoT device. In an aspect, a first device (for example, a network device or a terminal device acting as an intermediate node) receives, from a second device (for example, a base station), a configuration for providing a synchronization service for a third device (for example, an IoT device, such as an A-IoT device). The first device determines, based on the configuration, a resource for transmitting a plurality of signals for synchronization of the third device. Moreover, the first device transmits, to the third device, the plurality of signals on the resource. In this way, it is possible to improve the flexibility and efficiency of the synchronization procedure of the third device.
