

METHOD AND APPARATUS FOR DETERMINING FEATURE WORDS AND SERVER

ABSTRACT

The present specification provides a method and apparatus for determining
5 feature words and a server. The method includes: obtaining text data; extracting a first
feature word from the text data; updating a word segmentation library based on the
first feature word to obtain an updated word segmentation library, the word
segmentation library including a plurality of predetermined feature words for
representing predetermined attribute types; and extracting a second feature word from
10 the text data based on the updated word segmentation library and the predetermined
feature words. In implementations of the present specification, a new word is
extracted from the text data to obtain the first feature word; then the word
segmentation library is updated by using the first feature word; and further, a new
feature word can be extracted from the text data as the second feature word by using
15 the updated word segmentation library and the predetermined feature words, thereby
avoiding inaccurate feature word extraction caused by a word segmentation error
during extraction of feature words, and achieving the technical effect of accurately
identifying new feature words meeting requirements from the text data.
