

Silane Coupling Agent, Negative-Tone Photosensitive Resin Composition, Cured
Film, and Component for Touch Panel

ABSTRACT

The present invention is a silane coupling agent represented by Formula (1).

- 5 The present invention provides a silane coupling agent that is superior in improving adhesion to a substrate surface made of metal or inorganic matter and a composition using the same.

- (Each R^1 may be the same or different from each other and represents $\text{C}_1\text{-C}_6$ alkyl;
10 the alkyl may further have a substituent(s); n represents 0 or 1; R^2 represents a $\text{C}_3\text{-C}_{30}$ trivalent organic group; and R^3 may be the same or different from each other and represents $\text{C}_1\text{-C}_6$ alkyl, $\text{C}_1\text{-C}_6$ alkoxy, phenyl, hydroxyl, and phenoxy, among which groups for R^3 groups other than hydroxyl may further have a substituent(s)).
