Synthesis of Taxol and its derivatives.

This invention was made with Government support under NIH Grant #CA 42031 awarded by the National Institutes of Health. The United States Government has certain rights in the invention.

BACKGROUND OF THE INVENTION

The present invention is directed to a process for the synthesis of taxol and other tricyclic and tetracyclic taxanes and novel intermediates thereof.

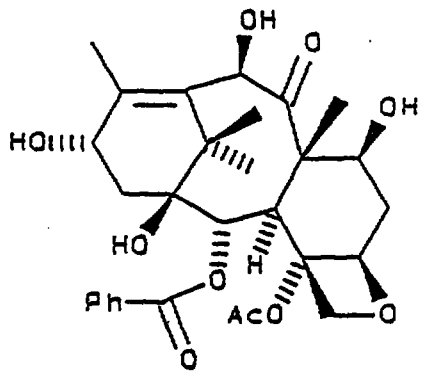

The taxane family of terpenes, of which taxol is a member, has attracted considerable interest in both the biological and chemical arts. Taxol is a promising cancer chemotherapeutic agent with a broad spectrum of antileukemic and tumor-inhibiting activity. Taxol has the following structure:

wherein Ac is acetyl.

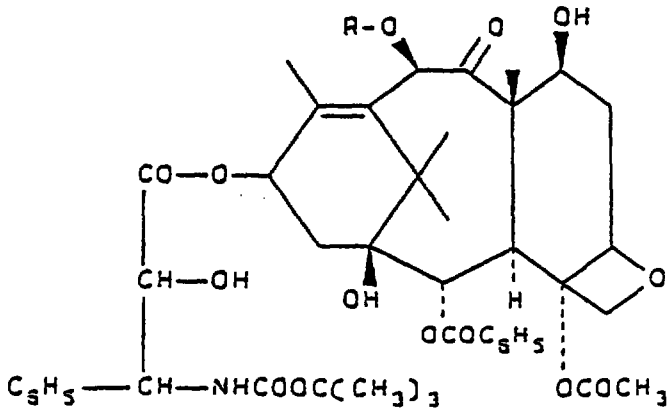

The supply of taxol is presently being provided by the bark from Taxus brevifollia (Western Yew). However, taxol is found only in minute quantities in the bark of these slow growing evergreens. Consequently, chemists in recent years have expended their energies in trying to find a viable synthetic route for the preparation of taxol. To date, the results have not been entirely satisfactory.

A semi-synthetic approach to the preparation of taxol has been described by Greene, et al. in JACS 110, 5917 (1988), and involves the use of a congener of taxol, 10-deacetyl baccatin III which has the structure of formula II shown below:

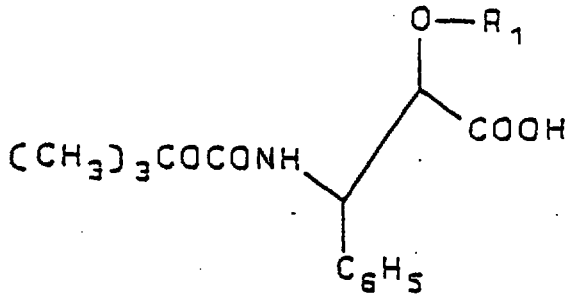

10-deacetyl baccatin III is more readily available than taxol since it can be obtained from the needles of Taxus baccata. According to the method of Greene et al., 10-deacetyl baccatin III ("10-DAB") is converted to taxol by attachment of the C-10 acetyl group and by attachment of the C-13 ß-amido ester side chain through the esterification of the C-13 alcohol with a ß-amido carboxylic acid unit.

Denis et al. in U.S. Patent No. 4,924,011 disclose another process for preparing derivatives of baccatin III or of 10-deacetylbaccatin III of general formula

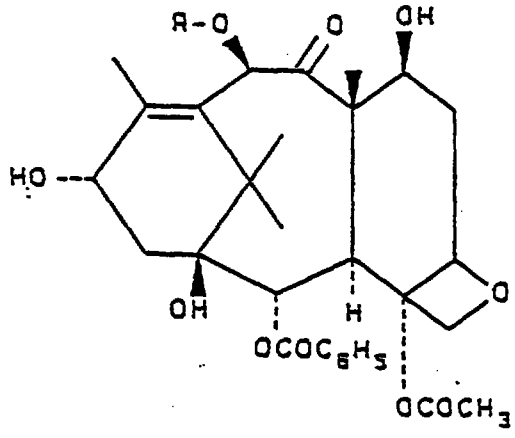

(V)

in which R' denotes hydrogen or acetyl. As reported, an acid of general formula:

in which R_1 is a hydroxy-protecting group, is condensed with a taxane derivative of general formula:

(VII)

in which R_2 is an acetyl hydroxy-protecting group and R_3 is a hydroxy-protecting group, and the protecting groups R_1, R_3 and, where appropriate, R_2 are then replaced by hydrogen.

Other semisynthetic approaches for the preparation of taxol and for the preparation of other taxanes which possess tumor-inhibiting properties have been reported in recent years, but each of these approaches requires 10-DAB or baccatin III as a starting material. As such, the supply of taxol and other taxane derivatives remains dependent at least to some extent upon the collection of various parts of plants from the

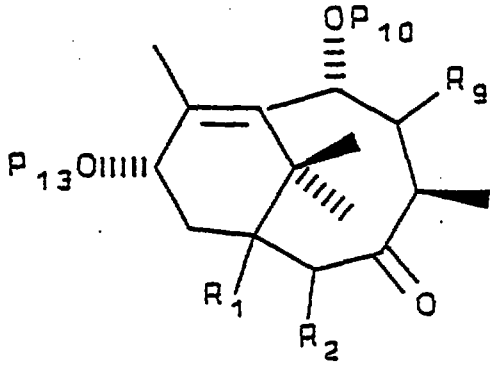

remote corners of the world and the extraction of 10-DAB and/or baccatin III therefrom.

SUMMARY OF THE INVENTION

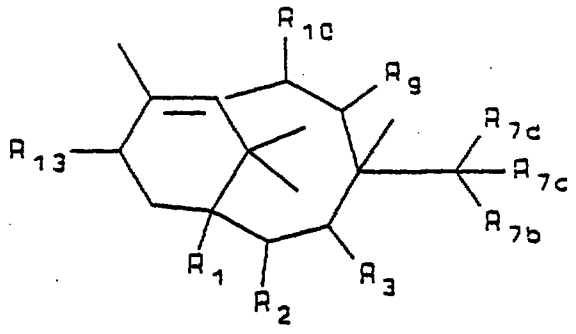

Among the objects of the present invention, therefore, is the provision of a process for the synthesis of taxol and other tetracyclic taxanes; the provision of such a process which is highly diastereoselective; the provision of such a process which proceeds in relatively high yield; and the provision of key intermediates and processes for their preparation.

Briefly, therefore, the present invention is directed to a process for the preparation of taxol and other tricyclic and tetracyclic taxanes.

In accordance with one aspect of the present invention, the process comprises reacting a compound having the formula

with $BrMgN(iPr)_2$, an aldehyde (or ketone), followed by phosgene and an alcohol to form a compound having the formula:

wherein

R_1 is hydrogen or protected hydroxy; R_2 is hydrogen or protected hydroxy;

R_3 is oxo;

R_{7b} is hydrogen, alkyl, cyano, hydroxy, protected hydroxy, or $-OCOR_{16}$;

R_{7c} and R_{7d} are independently hydrogen, alkyl, alkenyl, alkynyl, aryl or heteroaryl;

R_9 is hydrogen, protected hydroxy, or oxo;

R_{10} is $-OP_{10}$;

R_{13} is $-OP_{13}$;

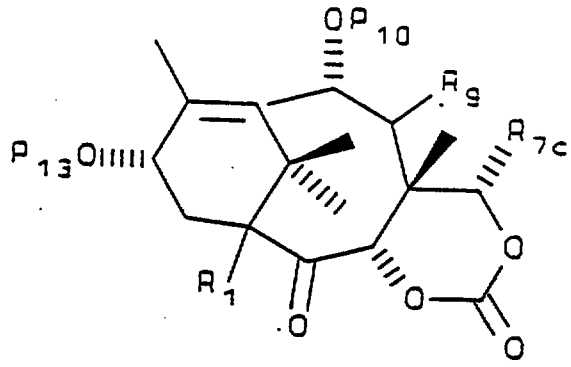

R_{16} is hydrogen, alkyl, alkenyl, alkynyl, alkoxy, aryloxy, $-NX_8X_{10}$, $-SX_{10}$, monocyclic aryl or monocyclic heteroaryl;

X_8 is hydrogen, alkyl, alkenyl, alkynyl, aryl, or heteroaryl;

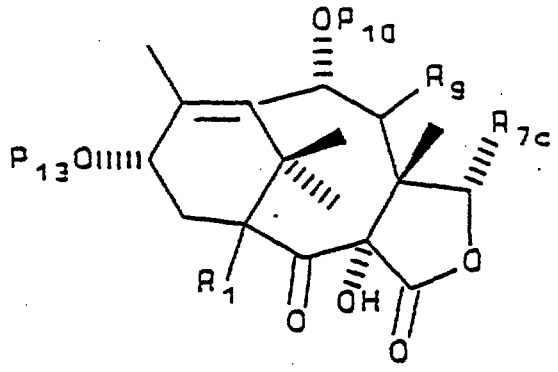

X_{10} is alkyl, alkenyl, alkynyl, aryl, or heteroaryl; and

P_{10} and P_{13} are hydroxy protecting groups.

In accordance with another aspect of the present invention, the process comprises reacting a compound having the formula

with lithium tetramethylpiperidide to form a compound having the formula:

;

wherein

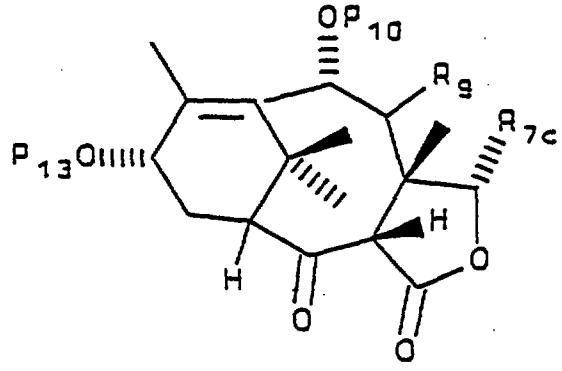

R_1 is hydrogen or protected hydroxy;

R_{7c} is hydrogen, alkyl, alkenyl, alkynyl, aryl or heteroaryl;

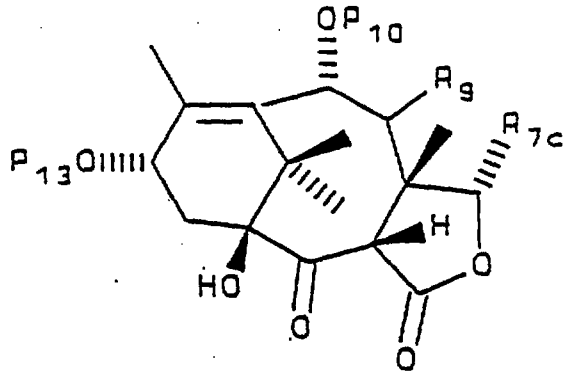

R_9 is hydrogen, protected hydroxy, or oxo; and

P_{10} and P_{13} are hydroxy protecting groups.

In accordance with another aspect of the present invention, the process comprises reacting a compound having the formula:

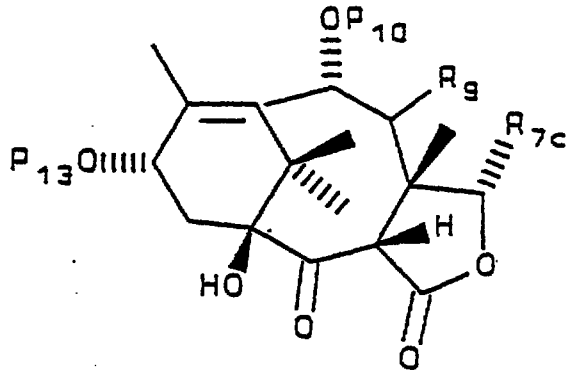

with lithium tetramethylpiperidide and camphosulfonyl oxaziridine to form a compound having the formula:

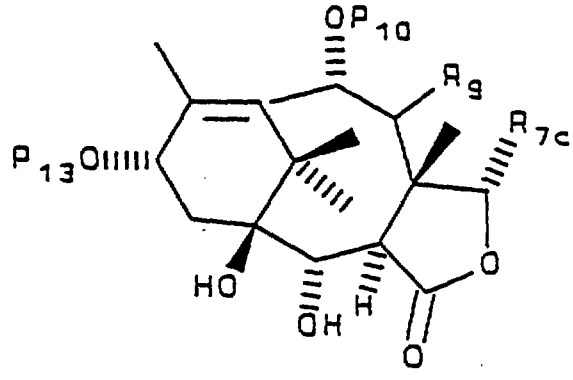

;

wherein R_9 is hydrogen, protected hydroxy, or oxo; R_{7c} is hydrogen, alkyl, alkenyl, alkynyl, aryl or heteroaryl; and P_{10} and P_{13} are hydroxy protecting groups.

In accordance with another aspect of the present invention, the process comprises reacting a compound having the formula:

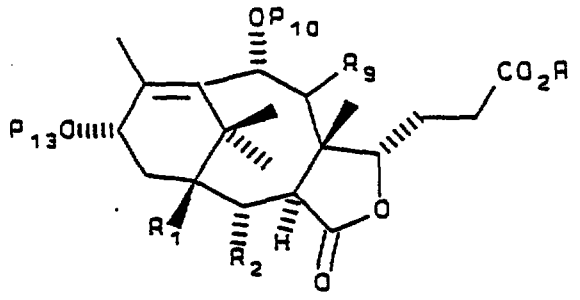

with a hydride reducing agent, preferably Red-Al, to form a compound having the formula:

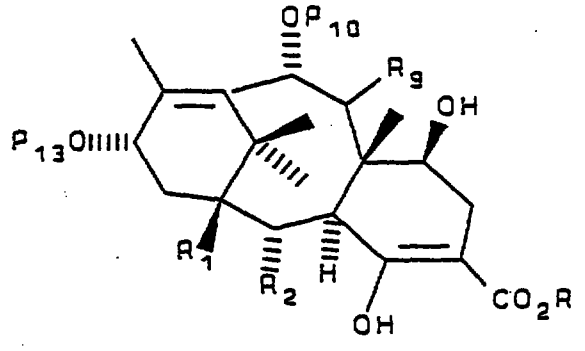

;

wherein R_1 is hydrogen, protected hydroxy, or oxo; R_9 is hydrogen, alkyl, alkenyl, alkynyl, aryl or heteroaryl; and P_{10} and P_{13} are hydroxy protecting groups.

In accordance with another aspect of the present invention, the process comprises reacting a compound having the formula:

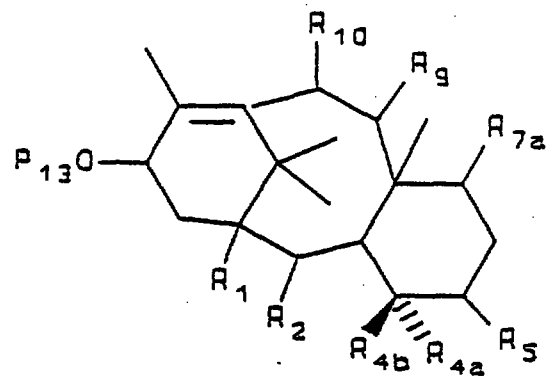

with lithium diisopropylamide to form a compound having the formula:

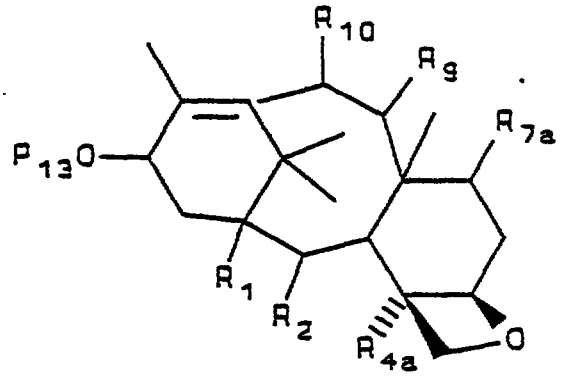

;

wherein R is lower alkyl, R_1 is hydrogen, protected hydroxy or R_1 and R_2 together form a carbonate, R_2 is hydrogen, protected hydroxy or R_1 and R_2 together form a carbonate, R_9 is hydrogen, protected hydroxy, or oxo; and P_{10} and P_{13} are hydroxy protecting groups.

In accordance with another aspect of the present invention, the process comprises reacting a compound having the formula:

with DBU to form a compound having the formula:

wherein

R_1 is hydrogen, hydroxy, protected hydroxy or $-OCOR_{10}$, or together with R_2 is a carbonate;

R_2 is hydrogen, hydroxy, protected hydroxy, oxo, or $-OCOR_{11}$, or together with R_1 is a carbonate;

R_{4a} is hydrogen, alkyl, hydroxy, or protected hydroxy, or together with R_2 is a carbonate;

R_{4b} is hydroxymethylene;

R_5 is -OMs, -OTs or a bromide;

R_{7a} is hydrogen, protected hydroxy, or $-OCOR_{14}$, or together with R_9 is a carbonate;

R_9 is hydrogen, oxo, hydroxy, protected hydroxy, or $-OCOR_{13}$, or together with R_{7a} or R_{10} is a carbonate;

R_{10} is hydrogen, oxo, hydroxy, protected hydroxy, or $-OCOR_{19}$, or together with R_9 is a carbonate;

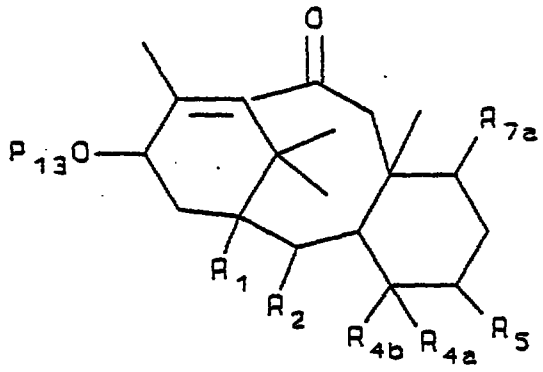

P_{13} is a hydroxy protecting group;

R_{29}, R_{30}, R_{31}, R_{33}, and R_{34} are independently hydrogen, alkyl, alkenyl, alkynyl, alkoxy, aryloxy, $-NX_9X_{10}$, $-SX_{10}$, monocyclic aryl or monocyclic heteroaryl;

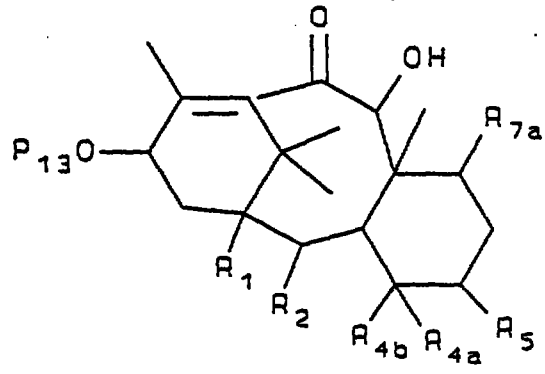

X_9 is hydrogen, alkyl, alkenyl, alkynyl, aryl, or heteroaryl; and

X_{10} is alkyl, alkenyl, alkynyl, aryl, or heteroaryl.

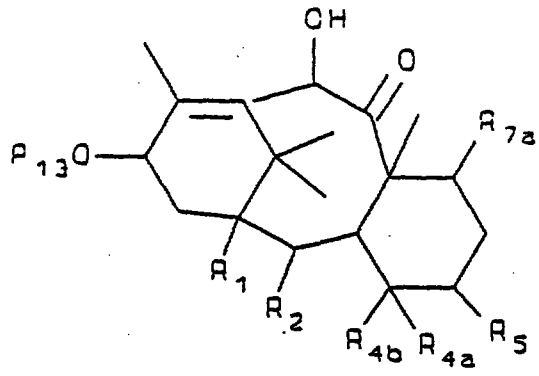

In accordance with another aspect of the present invention, the process comprises reacting a compound having the formula:

with KOtBu and $(PhSeO)_2O$ to form a compound having the formula:

which rearranges in the presence of additional KOtBu, silica gel, or other acids or bases, or with heat to a compound having the formula:

wherein

R_1 is hydrogen, hydroxy, protected hydroxy, or $-OCOR_{30}$, or together with R_2 is a carbonate;

R_2 is hydrogen, protected hydroxy, or $-OCOR_{31}$, or together with R_1 or R_{4a} is a carbonate;

R_{4a} is hydrogen, alkyl, hydroxy, protected hydroxy, or $-OCOR_{27}$, together with R_{4b} is an oxo, or together with R_2, R_{4b}, or R_5 is a carbonate;

R_{4b} is hydrogen, alkyl, alkenyl, alkynyl, aryl, heteroaryl, or cyano, together with R_{4a} is an oxo, together with R_{4a} or R_5 is a carbonate, or together with R_5 and the carbons to which they are attached form an oxetane ring;

R_5 is hydrogen, protected hydroxy, $-OCOR_{37}$, together with R_{4a} or R_{4b} is a carbonate, or together with R_{4b} and the carbons to which they are attached form an oxetane ring;

R_{7a} is hydrogen, halogen, protected hydroxy, or $-OCOR_{34}$;

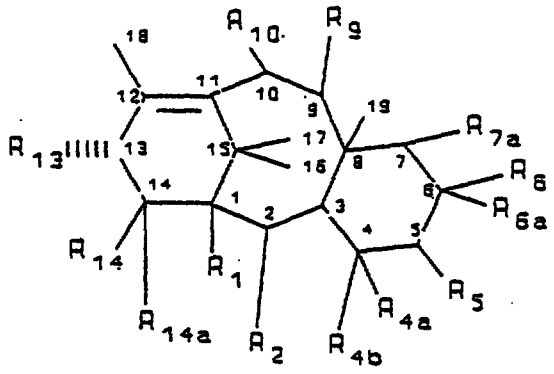

P_{13} is a hydroxy protecting group;

R_{27}, R_{30}, R_{31}, R_{34}, and R_{37} are independently hydrogen, alkyl, alkenyl, alkynyl, alkoxy, aryloxy, $-NX_9X_{10}$, $-SX_{10}$, monocyclic aryl or monocyclic heteroaryl;

X_9 is hydrogen, alkyl, alkenyl, alkynyl, aryl, heteroaryl, or heterosubstituted alkyl, alkenyl, alkynyl, aryl or heteroaryl; and

X_{10} is alkyl, alkenyl, alkynyl, aryl, heteroaryl, or heterosubstituted alkyl, alkenyl alkynyl, aryl or heteroaryl.

In general, the process of the present invention may be used to prepare taxanes having the formula:

(1)

wherein

R_1 is hydrogen, hydroxy, protected hydroxy, or $-OCOR_{30}$;

R_2 is hydrogen, hydroxy, $-OCOR_{31}$, or oxo;

R_{4a} is hydrogen, alkyl, alkenyl, alkynyl, aryl, heteroaryl, cyano, hydroxy, $-OCOR_{27}$, or together with R_{4b} forms an oxo, oxirane or methylene;

R_{4b} is hydrogen, together with R_{4a} forms an oxo, oxirane or methylene, or together with R_5 and the carbon atoms to which they are attached form an oxetane ring;

R_5 is hydrogen, halogen, hydroxy, protected hydroxy, $-OCOR_{37}$, oxo, or together with R_{4b} and the carbon atoms to which they are attached form an oxetane ring;

R_6 is hydrogen, alkyl, alkenyl, alkynyl, aryl, or heteroaryl, hydroxy, protected hydroxy or together with R_{6a} forms an oxo;

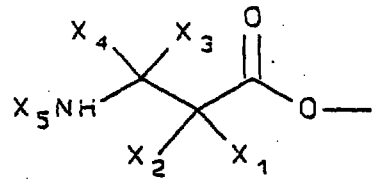

R_{6a} is hydrogen, alkyl, alkenyl, alkynyl, aryl, or heteroaryl, hydroxy, protected hydroxy or together with R_6 forms an oxo;

R_{7a} is hydrogen, halogen, hydroxy, protected hydroxy, $-OCOR_{34}$, oxo, or $-OR_{29}$;

R_9 is hydrogen, hydroxy, protected hydroxy, acyloxy, or oxo;

R_{10} is hydrogen, $-OCOR_{29}$, hydroxy, protected hydroxy, or oxo;

R_{13} is hydroxy, protected hydroxy, MO- or

;

R_{14} is hydrogen, alkyl, alkenyl, alkynyl, aryl, or heteroaryl;

R_{14a} is hydrogen, alkyl, alkenyl, alkynyl, aryl, or heteroaryl, hydroxy, protected hydroxy or together with R_1 forms a carbonate;

R_{28} is a functional group which increases the solubility of the taxane;

R_{27}, R_{29}, R_{30}, R_{31}, R_{34} and R_{37} are independently hydrogen, alkyl, alkenyl, alkynyl, monocyclic aryl or monocyclic heteroaryl;

X_1 is $-OX_6$, $-SX_7$, or $-NX_8X_9$;

X_2 is hydrogen, alkyl, alkenyl, alkynyl, aryl, or heteroaryl;

X_3 and X_4 are independently hydrogen, alkyl, alkenyl, alkynyl, aryl, or heteroaryl;

X_5 is $-COX_{10}$, $-COOX_{10}$, $-COSX_{10}$, $-CONX_8X_{10}$, or $-SO_2X_{11}$;

X_6 is hydrogen, alkyl, alkenyl, alkynyl, aryl, heteroaryl, hydroxy protecting group, or a functional group which increases the water solubility of the taxane derivative;

X_7 is alkyl, alkenyl, alkynyl, aryl, heteroaryl, or sulfhydryl protecting group;

X_8 is hydrogen, alkyl, alkenyl, alkynyl, aryl, heteroaryl, or heterosubstituted alkyl, alkenyl, alkynyl, aryl or heteroaryl;

X_9 is an amino protecting group;

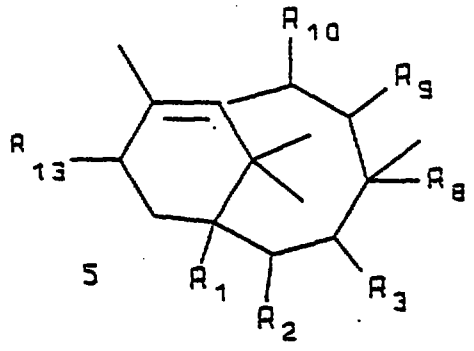

X_{10} is alkyl, alkenyl, alkynyl, aryl, heteroaryl, or heterosubstituted alkyl, alkenyl alkynyl, aryl or heteroaryl;

X_{11} is alkyl, alkenyl, alkynyl, aryl, heteroaryl, $-OX_{10}$, or $-NX_8X_{14}$;

X_{14} is hydrogen, alkyl, alkenyl, alkynyl, aryl, or heteroaryl; and

M comprises ammonium or is a metal.

The present invention is additionally directed to an intermediate for use in the preparation of a tricyclic or tetracyclic taxane having the formula:

wherein

R_1 is hydrogen, hydroxy, protected hydroxy or $-OCOR_{10}$, or together with R_2 is a carbonate;

R_2 is hydrogen, hydroxy, protected hydroxy, oxo, or $-OCOR_{31}$, or together with R_1 is a carbonate;

R_3 is hydrogen, hydroxy, protected hydroxy, $-OCOR_{32}$, or oxo;

R_8 is hydrogen, alkyl, alkenyl, alkynyl, aryl or heteroaryl;

R_9 is hydrogen, hydroxy, protected hydroxy, oxo, or $-OCOR_{33}$, or together with R_{10} is a carbonate;

R_{10} is hydrogen, hydroxy, protected hydroxy, oxo, or $-OCOR_{29}$, or together with R_9 is a carbonate;

R_{13} is hydrogen, hydroxy, protected hydroxy, $-OCOR_{35}$ or MO-;

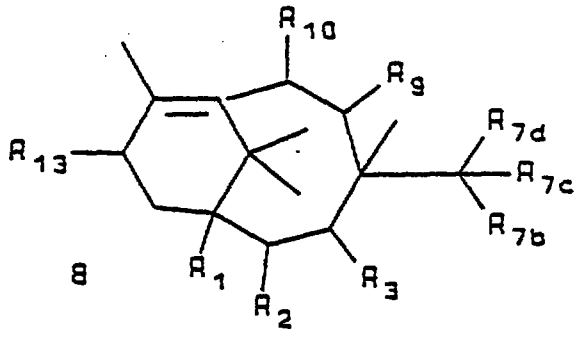

R_{29}, R_{30}, R_{31}, R_{32}, R_{33}, and R_{35} are independently hydrogen, alkyl, alkenyl, alkynyl, alkoxy, aryloxy, $-NX_9X_{10}$, $-SX_{10}$, monocyclic aryl or monocyclic heteroaryl;

X_9 is hydrogen, alkyl, alkenyl, alkynyl, aryl, or heteroaryl;

X_{10} is alkyl, alkenyl, alkynyl, aryl, or heteroaryl; and

M comprises ammonium or is a metal.

The present invention is further directed to an intermediate for use in the preparation of a tricyclic or tetracyclic taxane having the formula:

wherein

R_1 is hydrogen, hydroxy, protected hydroxy or $-OCOR_{10}$, or together with R_2 is a carbonate;

R_2 is hydrogen, hydroxy, protected hydroxy, oxo, or $-OCOR_{11}$, or together with R_1 is a carbonate;

R_3 is hydrogen, hydroxy, protected hydroxy, $-OCOR_{12}$, or oxo, or together with R_{7b} is a carbonate;

R_{7b} is hydrogen, alkyl, cyano, hydroxy, protected hydroxy, or $-OCOR_{16}$, or together with R_3 or R_9 is a carbonate;

R_{7c} and R_{7d} are independently hydrogen, alkyl, alkenyl, alkynyl, aryl or heteroaryl;

R_9 is hydrogen, hydroxy, protected hydroxy, oxo, or $-OCOR_{13}$, or together with R_{7b} or R_{10} is a carbonate;

R_{10} is hydrogen, hydroxy, protected hydroxy, oxo, or $-OCOR_{29}$, or together with R_9 is a carbonate;

R_{13} is hydrogen, hydroxy, protected hydroxy, $-OCOR_{15}$ or MO-;

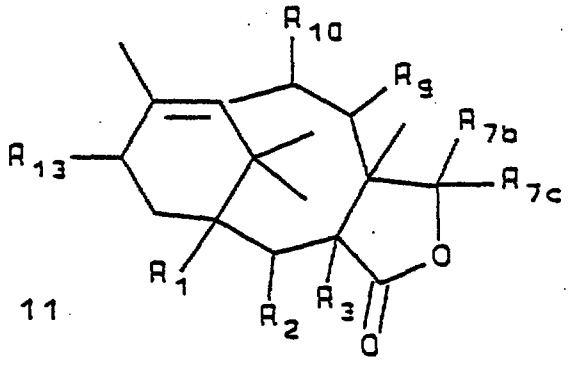

R_{29}, R_{10}, R_{11}, R_{12}, R_{13}, R_{15} and R_{16} are independently hydrogen, alkyl, alkenyl, alkynyl, alkoxy, aryloxy, $-NX_9X_{10}$, $-SX_{10}$, monocyclic aryl or monocyclic heteroaryl;

X_9 is hydrogen, alkyl, alkenyl, alkynyl, aryl, or heteroaryl;

X_{10} is alkyl, alkenyl, alkynyl, aryl, or heteroaryl; and

M comprises ammonium or is a metal.

The invention is further directed to an intermediate for use in the preparation of a tricyclic or tetracyclic taxane having the formula:

11

wherein

R_1 is hydrogen, hydroxy, protected hydroxy or $-OCOR_{10}$, or together with R_2 is a carbonate;

R_2 is hydrogen, hydroxy, protected hydroxy, oxo, or $-OCOR_{11}$, or together with R_1 is a carbonate;

R_3 is hydrogen, hydroxy, protected hydroxy, or $-OCOR_{12}$;

R_{7b} is hydrogen, alkyl, cyano, hydroxy, protected hydroxy, or $-OCOR_{16}$;

R_{7c} is hydrogen, alkyl, alkenyl, alkynyl, aryl or heteroaryl;

R_9 is hydrogen, hydroxy, protected hydroxy, oxo, or $-OCOR_{13}$, or together with R_{10} is a carbonate;

R_{10} is hydrogen, hydroxy, protected hydroxy, oxo, or $-OCOR_{29}$, or together with R_9 is a carbonate;

R_{13} is hydrogen, hydroxy, protected hydroxy, $-OCOR_{35}$ or MO-;

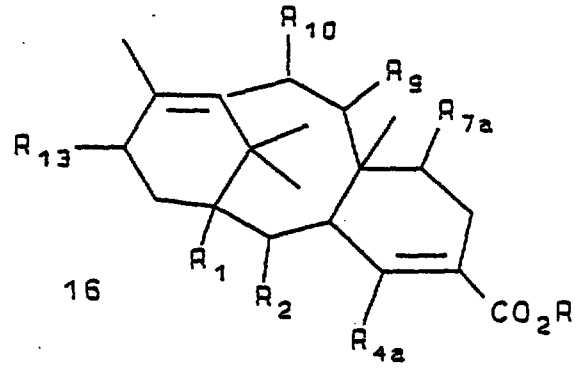

R_{29}, R_{30}, R_{31}, R_{32}, R_{33}, R_{35}, and R_{36} are independently hydrogen, alkyl, alkenyl, alkynyl, alkoxy, aryloxy, $-NX_9X_{10}$, $-SX_{10}$, monocyclic aryl or monocyclic heteroaryl;

X_9 is hydrogen, alkyl, alkenyl, alkynyl, aryl, or heteroaryl;

X_{10} is alkyl, alkenyl, alkynyl, aryl, or heteroaryl; and

M comprises ammonium or is a metal.

The present invention is further directed to an intermediate for use in the preparation of a tricyclic or tetracyclic taxane having the formula:

DETAILED DESCRIPTION OF THE PREFERRED EMBODIMENTS

As used herein "Ar" means aryl; "Ph" means phenyl; "Me" means methyl; "Et" means ethyl; "iPr" means isopropyl; "tBu" and "t-Bu" means tert-butyl; "R" means lower alkyl unless otherwise defined; "Ac" means acetyl; "py" means pyridine; "TES" means triethylsilyl; "TMS"

means trimethyl-silyl; "TBS" means Me_2t-BuSi-; "Tf" means $-SO_2CF_3$; "BMDA" means $BrMgNiPr_2$; "Swern" means $(COCl)_2$, Et_3N; "LTMP" means lithium tetramethylpiperidide; "MOP" means 2-methoxy-2-propyl; "BOM" means benzyloxymethyl; "LDA" means lithium diisopropylamide; "LAH" means lithium aluminum hydride; "Red-Al" means sodium bis(2-methoxyethoxy) aluminum hydride; "Ms" means CH_3SO_2-; "TASF" means tris(diethylamino)sulfonium-difluorotrimethylsilicate; "Ts" means toluenesulfonyl; "TBAF" means tetrabutyl ammonium hydride; "TPAP" means tetrapropyl-ammonium perruthenate; "DBU" means diazabicycloundecane; "DMAP" means p-dimethylamino pyridine; "LHMDS" means lithium hexamethyldisilazide; "DMF" means dimethylformamide; "AIBN" means azo-(bis)-isobutyronitrile; "10-DAB" means 10-desacetylbaccatin III; "FAR" means 2-chloro-1,1,2-trifluorotriethylamine; "mCPBA" means metachloroperbenzoic acid; "DDQ" means dicyanodichloroquinone; "sulfhydryl protecting group" includes, but is not limited to, hemithioacetals such as 1-ethoxyethyl and methoxymethyl, thioesters, or thiocarbonates; "amine protecting group" includes, but is not limited to, carbamates, for example, 2,2,2-trichloroethylcarbamate or tertbutylcarbamate; "protected hydroxy" means -OP wherein P is a hydroxy protecting group; and "hydroxy protecting group" includes, but is not limited to, acetals having two to ten carbons, ketals having two to ten carbons, ethers such as methyl, t-butyl, benzyl, p-methoxybenzyl, p-nitrobenzyl, allyl, trityl, methoxymethyl, methoxyethoxymethyl, ethoxyethyl, tetrahydropyranyl, tetrahydrothiopyranyl, and trialkylsilyl ethers such as trimethylsilyl ether, triethylsilyl ether, dimethylarylsilyl ether, triisopropylsilyl ether and t-butyldimethylsilyl ether; esters such as benzoyl, acetyl, phenylacetyl, formyl, mono-, di-, and trihaloacetyl such as chloroacetyl, dichloroacetyl,

trichloroacetyl, trifluoro-acetyl; and carbonates including but not limited to alkyl carbonates having from one to six carbon atoms such as methyl, ethyl, n-propyl, isopropyl, n-butyl, t-butyl; isobutyl, and n-pentyl; alkyl carbonates having from one to six carbon atoms and substituted with one or more halogen atoms such as 2,2,2-trichloroethoxymethyl and 2,2,2-tri-chloroethyl; alkenyl carbonates having from two to six carbon atoms such as vinyl and allyl; cycloalkyl carbonates having from three to six carbon atoms such as cyclopropyl, cyclobutyl, cyclopentyl and cyclohexyl; and phenyl or benzyl carbonates optionally substituted on the ring with one or more C_{1-4} alkoxy, or nitro. Other hydroxyl, sulfhydryl and amine protecting groups may be found in "Protective Groups in Organic Synthesis" by T. W. Greene, John Wiley and Sons, 1981.

The alkyl groups described herein are preferably lower alkyl containing from one to six carbon atoms in the principal chain and up to 15 carbon atoms. They may be straight or branched chain and include methyl, ethyl, propyl, isopropyl, butyl, hexyl and the like. They may be hydrocarbon or heterosubstituted with the various substituents defined herein, including heteroalkyl, alkenyl, heteroalkenyl, alkynyl, heteroalkynyl, aryl, heteroaryl, and heterosubstituted heteroaryl.

The alkenyl groups described herein are preferably lower alkenyl containing from two to six carbon atoms in the principal chain and up to 15 carbon atoms. They may be straight or branched chain and include ethenyl, propenyl, isopropenyl, butenyl, isobutenyl, hexenyl, and the like. They may be hydrocarbon or heterosubstituted with the various substituents defined herein, including alkyl, heteroalkyl, heteroalkenyl, alkynyl, heteroalkynyl, aryl, heteroaryl, and heterosubstituted heteroaryl.

The alkynyl groups described herein are preferably lower alkynyl containing from two to six carbon atoms in the principal chain and up to 15 carbon atoms. They may be straight or branched chain and include ethynyl, propynyl, butynyl, isobutynyl, hexynyl, and the like. They may be hydrocarbon or heterosubstituted with the various substituents defined herein, including alkyl, heteroalkyl, alkenyl, heteroalkenyl, heteroalkynyl, aryl, heteroaryl, and heterosubstituted heteroaryl.

The aryl moieties described herein contain from 6 to 15 carbon atoms and include phenyl. They may be hydro-carbon or heterosubstituted with the various substituents defined herein, including alkyl, heteroalkyl, alkenyl, heteroalkenyl, alkynyl, heteroalkynyl, heteroaryl, and heterosubstituted heteroaryl. Phenyl is the more preferred aryl.

The heteroaryl moieties described herein contain from 5 to 15 atoms and include, furyl, thienyl, pyridyl and the like. They may be hydrocarbon or heterosubstituted with the various substituents defined herein, including alkyl, heteroalkyl, alkenyl, heteroalkenyl, alkynyl, heteroalkynyl, aryl, and heterosubstituted heteroaryl.

The acyl moieties described herein contain alkyl, alkenyl, alkynyl, aryl or heteroaryl groups.

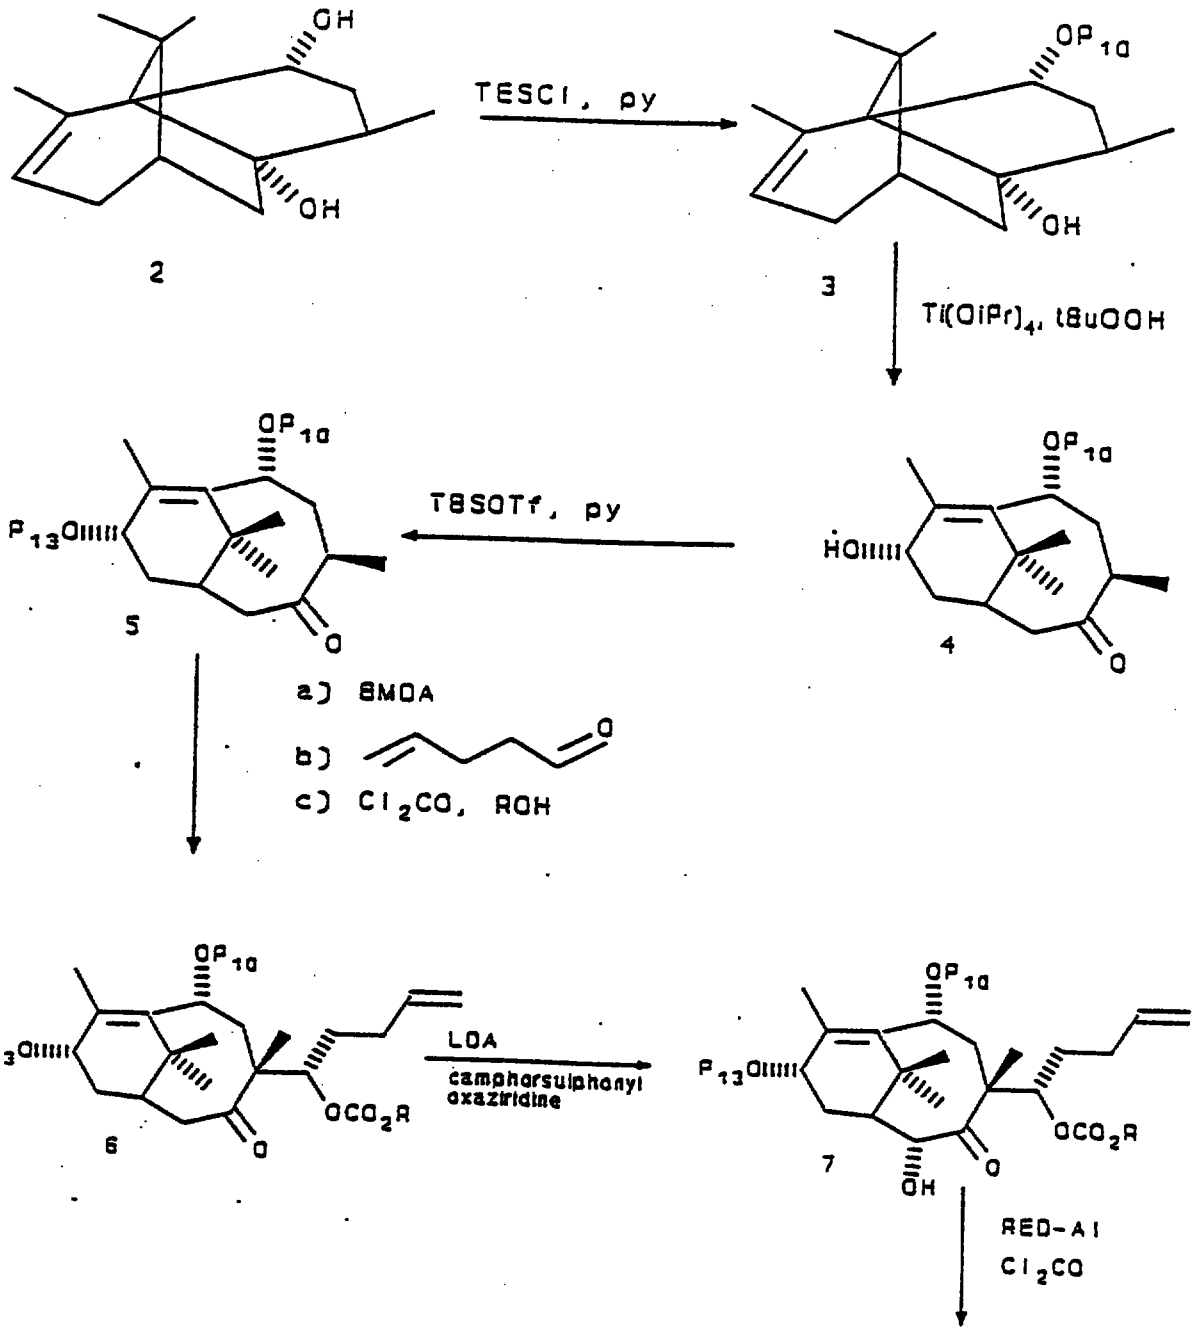

The alkoxycarbonyloxy moieties described herein comprise lower alkyl, alkenyl, alkynyl or aryl groups.

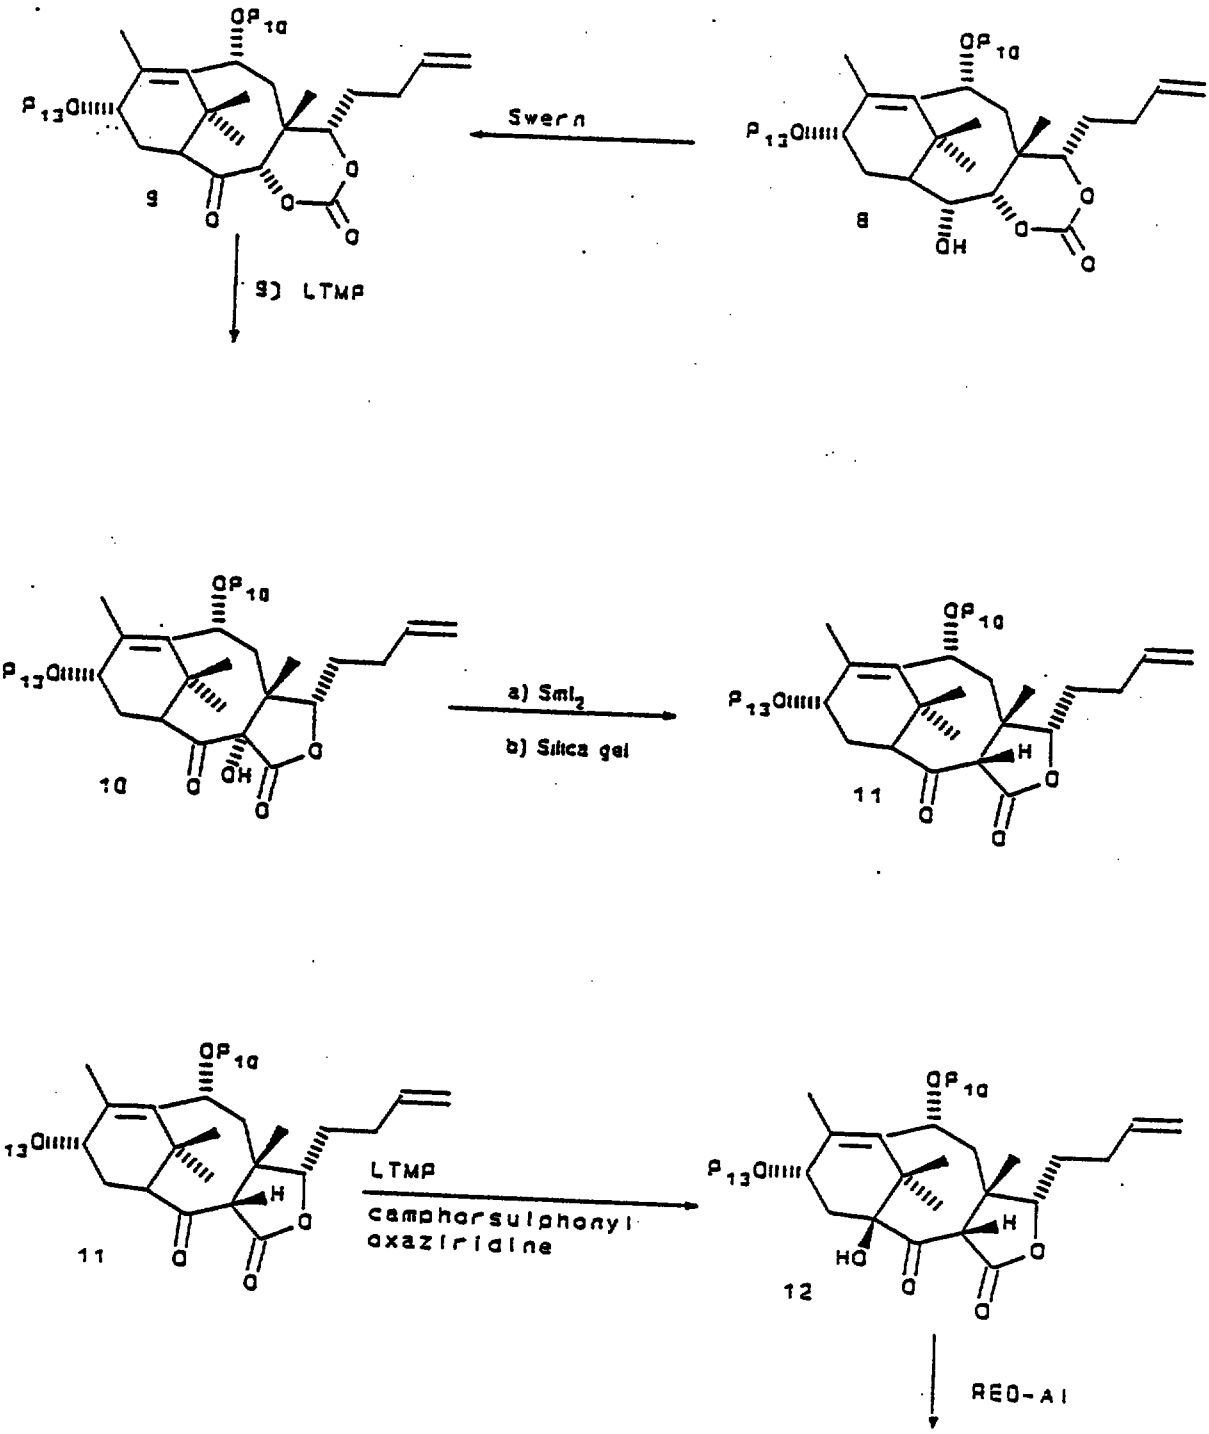

The hydrocarbon substituents described herein may be alkyl, alkenyl, alkynyl, or aryl, and the hetero-substituents of the heterosubstituted alkyl, alkenyl, alkynyl, aryl, and heteroaryl moieties described herein contain nitrogen, oxygen, sulfur, halogens and/or one to six carbons, and include lower alkoxy such as methoxy, ethoxy, butoxy, halogen such as chloro or fluoro, and nitro, heteroaryl such as furyl or thienyl, alkanoxy,

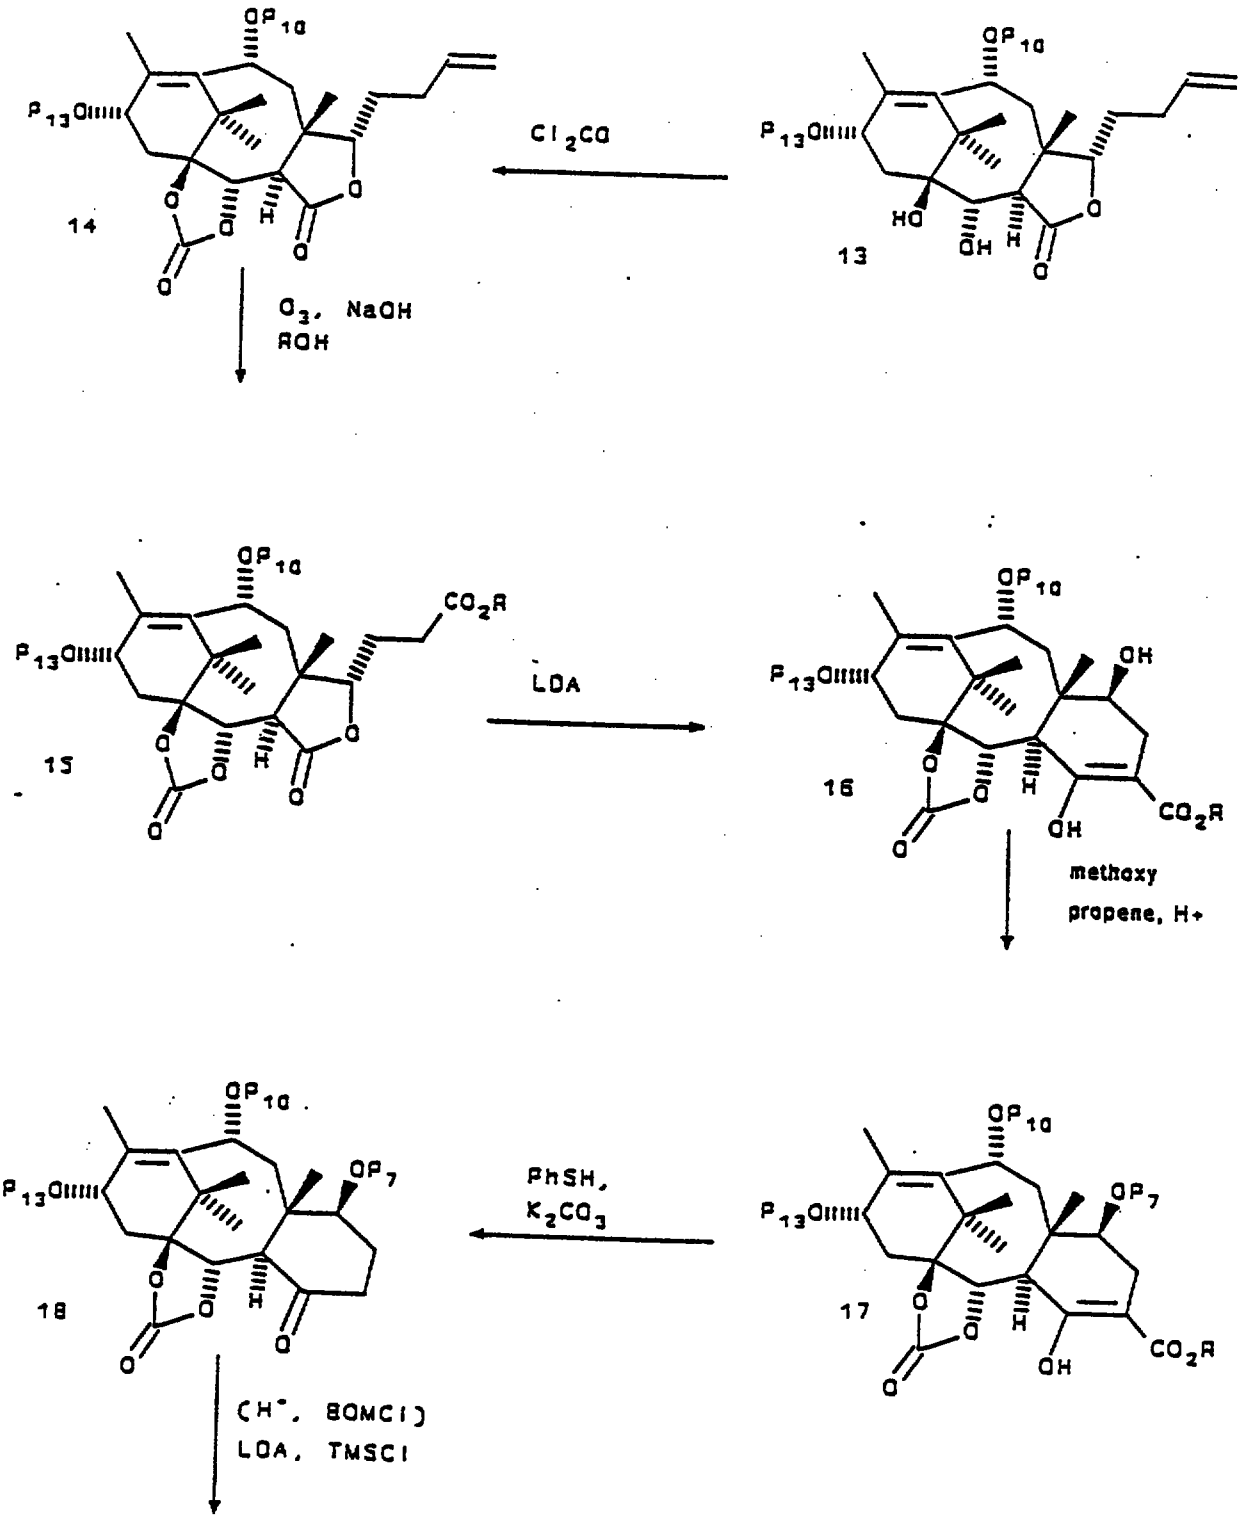

hydroxy, protected hydroxy, acyl, acyloxy, nitro, amino, and amido.

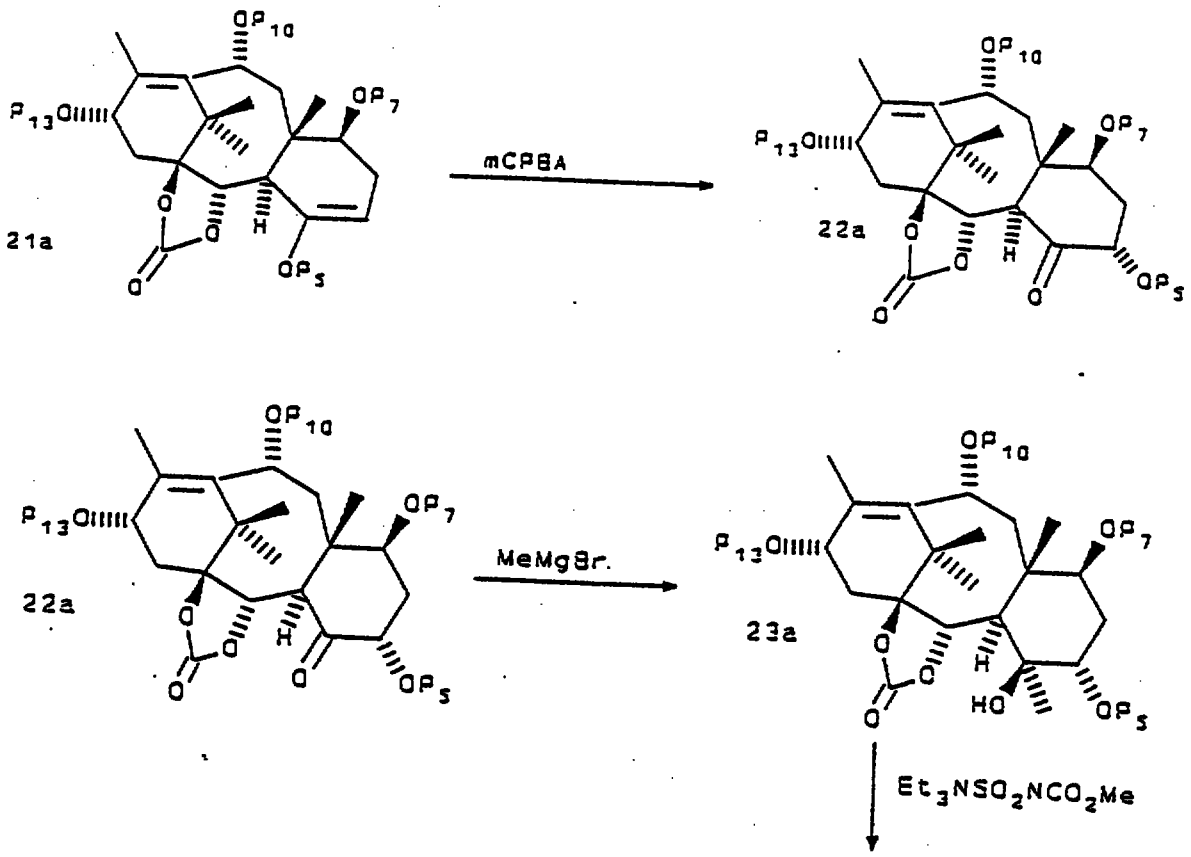

An exemplary synthesis of baccatin III or 10-DAB is depicted hereinbelow in Reaction Scheme A. The starting material, diol 2, can be prepared from patchino (commonly known as B-patchouline epoxide) which is commercially available. The patchino is first reacted with an organo-metallic, such as lithium t-butyl followed by oxidation with an organic peroxide, such as t-butylperoxide in the presence of titanium tetraisopropoxide to form a tertiary alcohol. The tertiary alcohol is then reacted with a Lewis acid, such as boron trifluoride at low temperature, in the range from 40°C to -100°C; in the presence of an acid, such as trifluoromethane sulfonic acid. A graphical depiction of this reaction scheme along with an experimental write-up for the preparation of diol 2 can be found in U.S. Patent No. 4,876,399.

In Reaction Scheme A, P_5 is TMS, P_7 is MOP or BOM, P_{10} is TES, P_{13} is TBS, and R is ethyl in compounds 6 and 7, methyl in compounds 15, 16, and 17, Ms in compounds 24aa and 26a, and Ts in compound 26aa. It should be understood, however, that P_5, P_7, P_{10}, and P_{13} may be other hydroxy protecting groups and R may comprise other lower alkyl substituents in compounds 6, 7, 15, 16 and 17.

Reaction Scheme A may be varied between compounds 18 and 29 as set forth below in Reaction Scheme A', with the reactions leading to compound 18 and following compound 29 being as set forth in Reaction Scheme A.

In Reaction Scheme A', P_5 is TMS or Ac, P_7 is MOP or BOM, P_{10} is TES, P_{13} is TBS and P_{520} is acetal or ketal, preferably acetonide. It should be understood, however, that P_5, P_7, P_{10}, and P_{13} and P_{520} may be other hydroxy protecting groups.

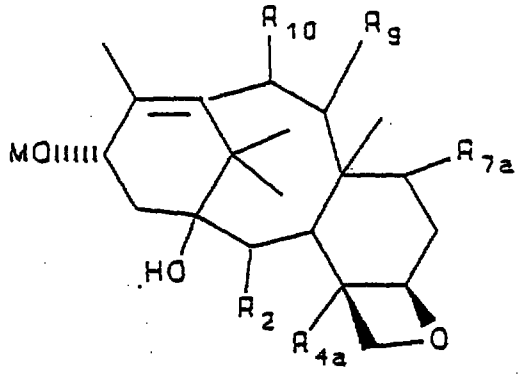

In general, tricyclic and tetracyclic taxanes bearing C13 side chains may be obtained by reacting a ß-lactam with alkoxides having the taxane tricyclic or tetracyclic nucleus and a C-13 metallic oxide substituent to form compounds having a ß-amido ester substituent at C-13. The ß-lactams have the following structural formula:

wherein X_1 - X_5 are as defined above. The alkoxides having the tricyclic or tetracyclic taxane nucleus and a C-13 metallic oxide or ammonium oxide substituent have the following structural formula:

wherein R_1, R_2, R_{4a}, R_{4b}, R_5, R_6, R_{6a}, R_{7a}, R_9, and R_{10} are as previously defined, R_{13} is -OM and M comprises ammonium or is a metal optionally selected from Group IA, IIA, transition (including lanthanides and actinides), IIB, IIIA IVA, VA, or VIA metals (CAS version). If M comprises ammonium, it is preferably tetraalkylammonium and the alkyl component of the tetraalkylammonium substituent is preferably C_1 - C_{10} alkyl such as methyl or butyl. Most preferably, the alkoxide has the tetracyclic taxane nucleus and corresponds to the structural formula:

wherein M, R_2, R_{4a}, R_{7a}, R_9, and R_{10} are as previously defined.

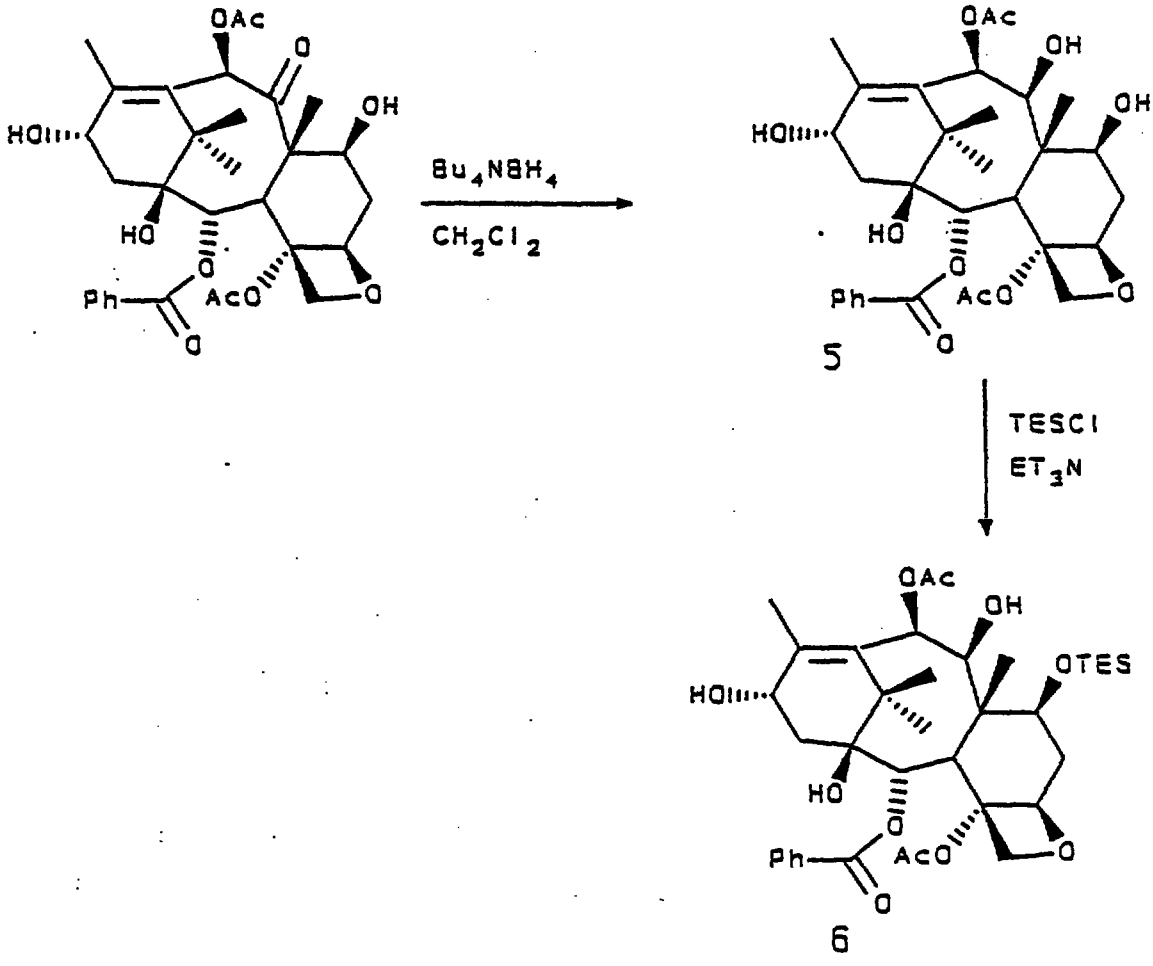

As set forth in Reaction Scheme A, taxol may be prepared by converting 7-protected Baccatin III 35 to the corresponding alkoxide and reacting the alkoxide with a β-lactam in which X_1 is protected hydroxy, X_3 is phenyl and X_5 is benzoyl. Protecting groups such as 2-methoxypropyl ("MOP"), 1-ethoxyethyl ("EE") are preferred, but a variety of other standard protecting groups such as the triethylsilyl group or other trialkyl (or aryl) silyl groups may be used. Taxanes having alternative side chain Substitutes may be prepared through the use of β-lactams which comprise the alternative substituents.

Taxanes having alternative C9 substituents may be prepared by selectively reducing the C9 keto substituent of taxol, 10-DAB, Baccatin III or one of the other intermediates disclosed herein to yield the corresponding C9 β-hydroxy derivative. The reducing agent is preferably a borohydride and, most preferably, tetrabutylammoniumboro-hydride (Bu_4NBH_4) or triacetoxyborohydride.

As illustrated in Reaction Scheme 1, the reaction of baccatin III with Bu_4NBH_4 in methylene chloride yields 9-desoxo-9β-hydroxybaccatin III 5. After the C7 hydroxy group is protected with the triethylsilyl protecting group, for example, a suitable side chain may

be attached to 7-protected-9ß-hydroxy derivative 6 as elsewhere described herein. Removal of the remaining protecting groups thus yields 9β-hydroxy-desoxo taxol or other 9β-hydroxytetracylic taxane having a C13 side chain.

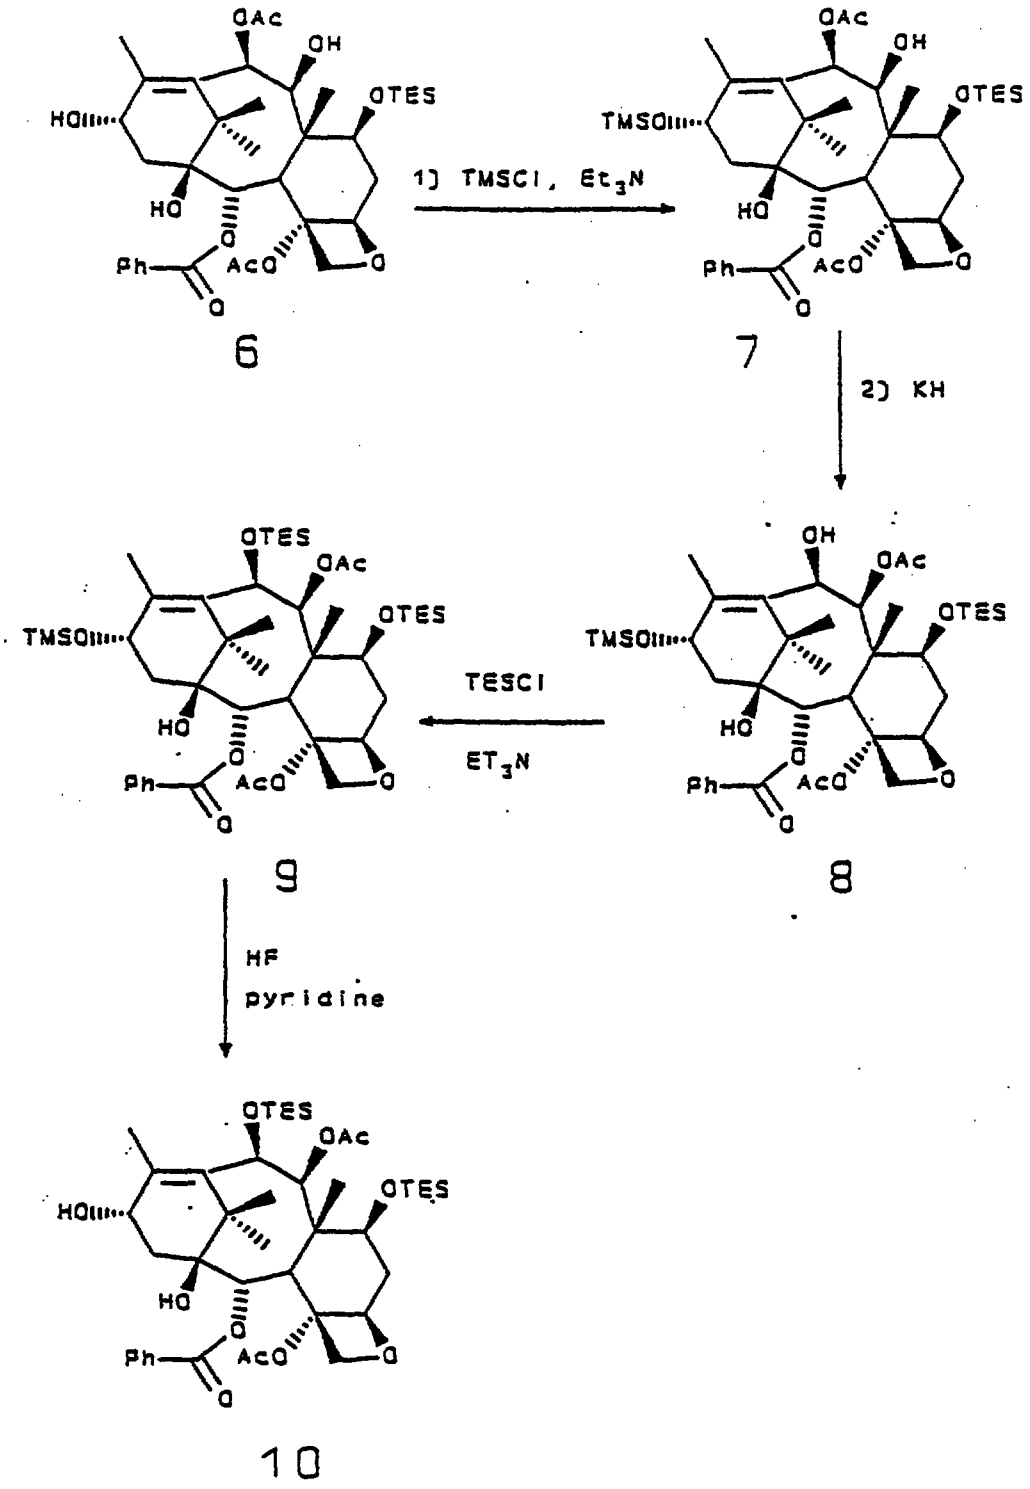

REACTION SCHEME 1

Alternatively, the C13 hydroxy group of 7-protected-9β-hydroxy derivative 6 may be protected with trimethylsilyl or other protecting group which can be selectively removed relative to the C7 hydroxy protecting group as illustrated in Reaction Scheme 2, to enable further selective manipulation of the various substituents of the taxane. For example, reaction of

7,13-protected-9β-hydroxy derivative 7 with KH causes the acetate group to migrate from C10 to C9 and the hydroxy group to migrate from C9 to C10, thereby yielding 10-desacetyl derivative 8. Protection of the C10 hydroxy group of 10-desacetyl derivative 8 with triethylsilyl yields derivative 9. Selective removal of the C13 hydroxy protecting group from derivative 9 yields derivative 10 to which a suitable side chain may be attached as described above.

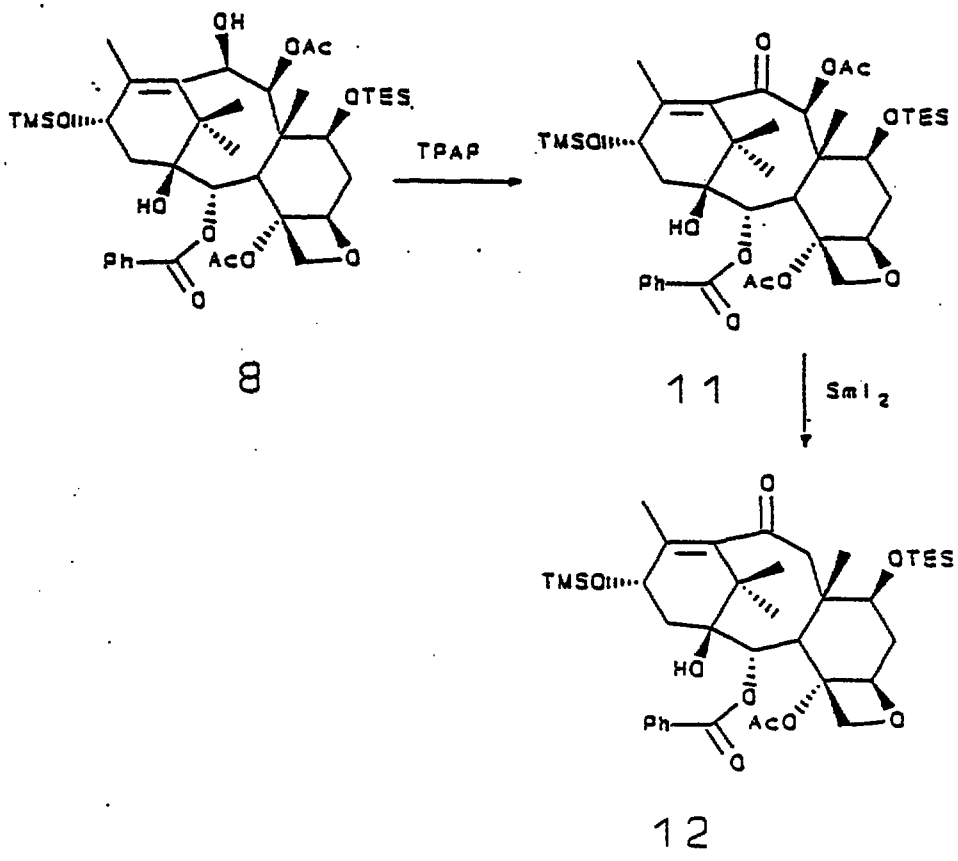

REACTION SCHEME 2

As shown in Reaction Scheme 3, 10-oxo derivative 11 can be provided by oxidation of 10-desacetyl derivative 8. Thereafter, the C13 hydroxy

protecting group can be selectively removed followed by attachment of a side chain as described above to yield 9-acetoxy-10-oxo-taxol or other 9-acetoxy-10-oxotetracylic taxanes having a C13 side chain. Alternatively, the C9 acetate group can be selectively removed by reduction of 10-oxo derivative 11 with a reducing agent such as samarium diiodide to yield 9-desoxo-10-oxo derivative 12 from which the C13 hydroxy protecting group can be selectively removed followed by attachment of a side chain as described above to yield 9-desoxo-10-oxo-taxol or other 9-desoxo-10-oxotetracylic taxanes having a C13 side chain.

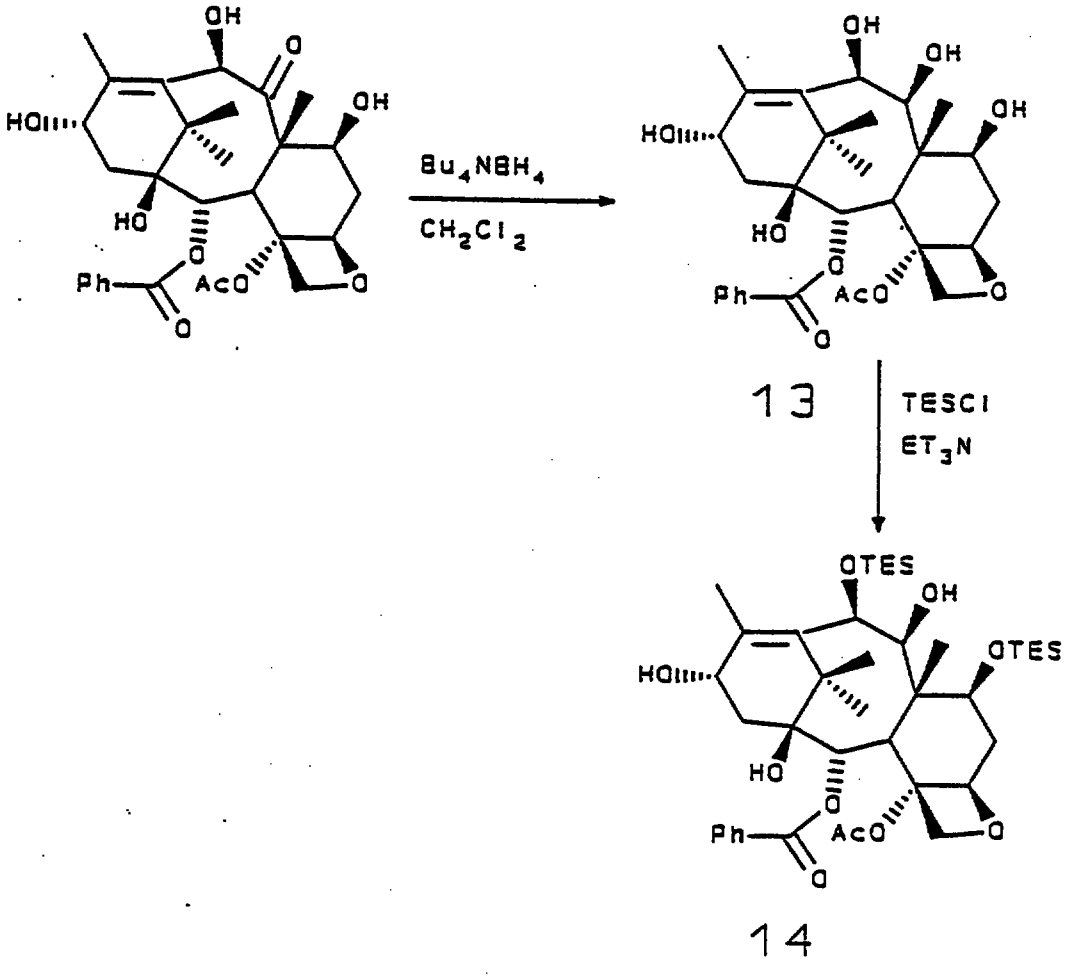

REACTION SCHEME 3

Reaction Scheme 4 illustrates a reaction in which 10-DAB is reduced to yield pentaol 13. The C7 and

C10 hydroxyl groups of pentaol 13 can then be selectively protected with the triethylsilyl or another protecting group to produce triol 14 to which a C13 side chain can be attached as described above or, alternatively, after further modification of the tetracylic substituents.

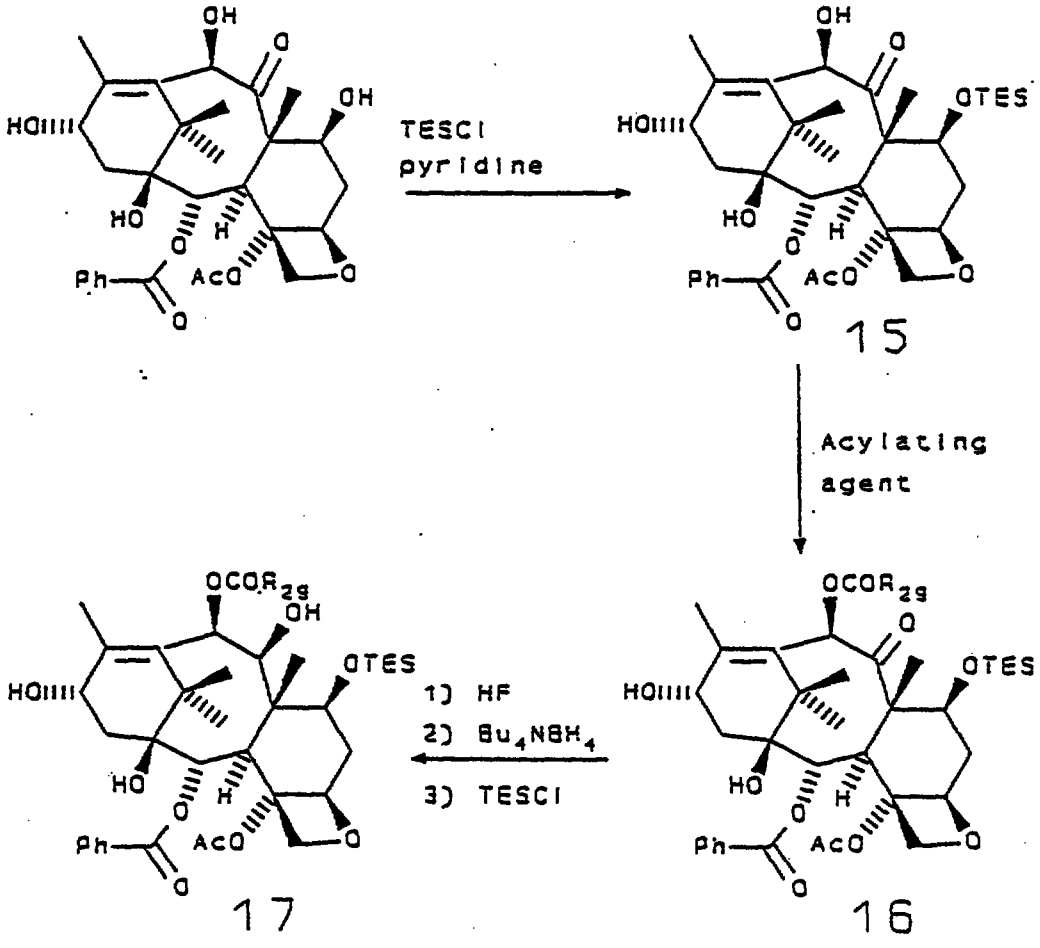

REACTION SCHEME 4

Taxanes having C9 and/or C10 acyloxy substituents other than acetate can be prepared using 10-DAB as a starting material as illustrated in Reaction Scheme 5. Reaction of 10-DAB with triethylsilyl chloride in pyridine yields 7-protected 10-DAB 15. The C10 hydroxy substituent of 7-protected 10-DAB 15 may then be readily acylated with any standard acylating agent to

yield derivative 16 having a new C10 acyloxy substituent. Selective reduction of the C9 keto substituent of derivative 16 yields 9ß-hydroxy derivative 17 to which a C13 side chain may be attached. Alternatively, the C10 and C9 groups can be caused to migrate as set forth in Reaction Scheme 2, above.

REACTION SCHEME 5

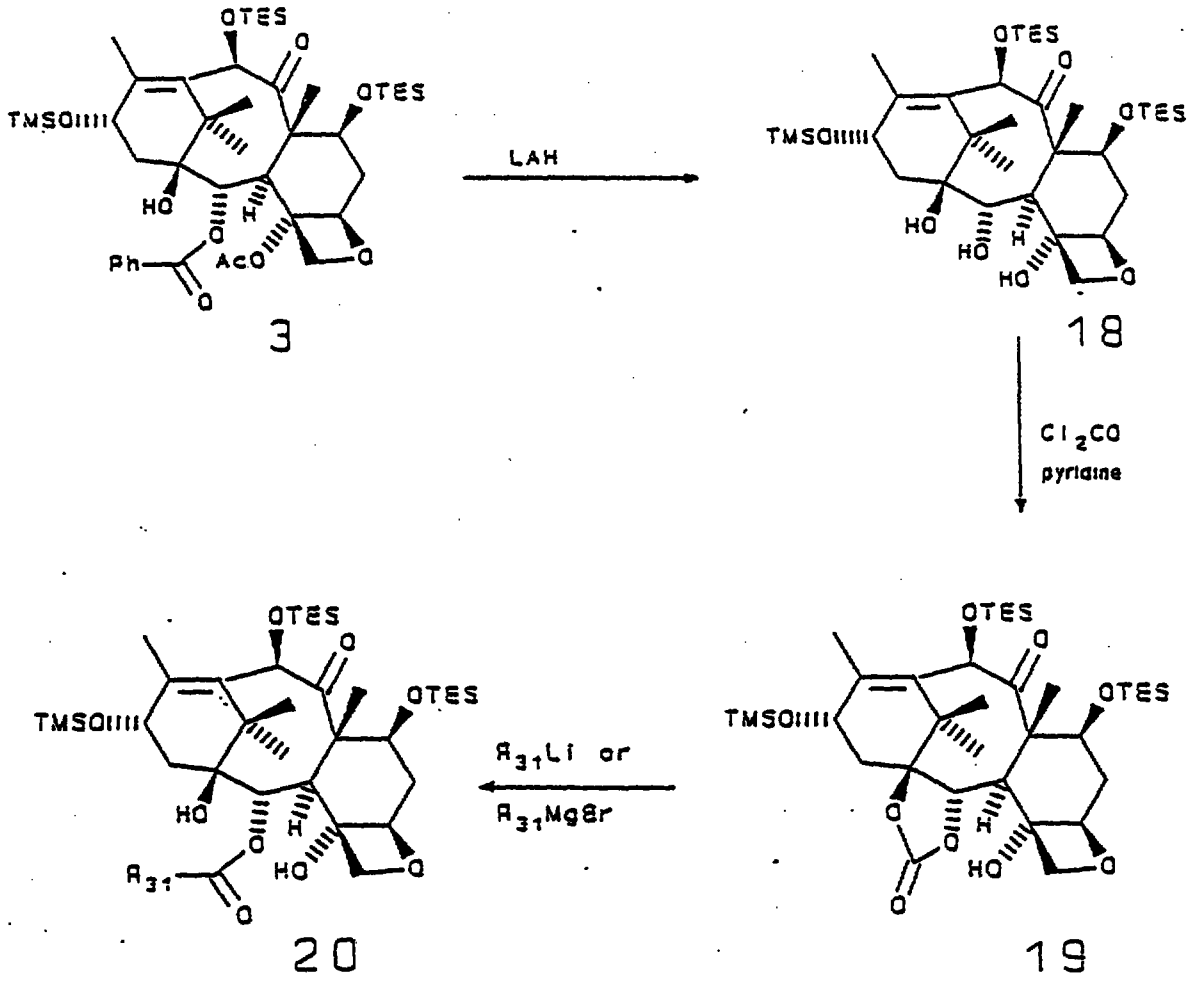

Taxanes having alternative C2 and/or C4 esters can be prepared using baccatin III and 10-DAB as starting materials. The C2 and/or C4 esters of baccatin III and 10-DAB can be selectively reduced to the corresponding alcohol(s) using reducing agents such as LAH or Red-Al, and new esters can thereafter be substituted using

standard acylating agents such as anhydrides and acid chlorides in combination with an amine such as pyridine, triethylamine, DMAP, or diisopropyl ethyl amine. Alternatively, the C2 and/or C4 alcohols may be converted to new C2 and/or C4 esters through formation of the corresponding alkoxide by treatment of the alcohol with a suitable base such as LDA followed by an acylating agent such as an acid chloride.

Baccatin III and 10-DAB analogs having different substituents at C2 and/or C4 can be prepared as set forth in Reaction Schemes 6-10. To simplify the description, 10-DAB is used as the starting material. It should be understood, however, that baccatin III derivatives or analogs may be produced using the same series of reactions (except for the protection of the C10 hydroxy group) by simply replacing 10-DAB with baccatin III as the starting material. 9-desoxo derivatives of the baccatin III and 10-DAB analogs having different substituents at C2 and/or C4 can then be prepared by reducing the C9 keto substituent of these analogs and carrying out the other reactions described above.

In Reaction Scheme 6, protected 10-DAB 3 is converted to the triol 18 with lithium aluminum hydride. Triol 18 is then converted to the corresponding C4 ester using Cl_2CO in pyridine followed by a nucleophilic agent (e.g., Grignard reagents or alkyllithium reagents).

Scheme 6

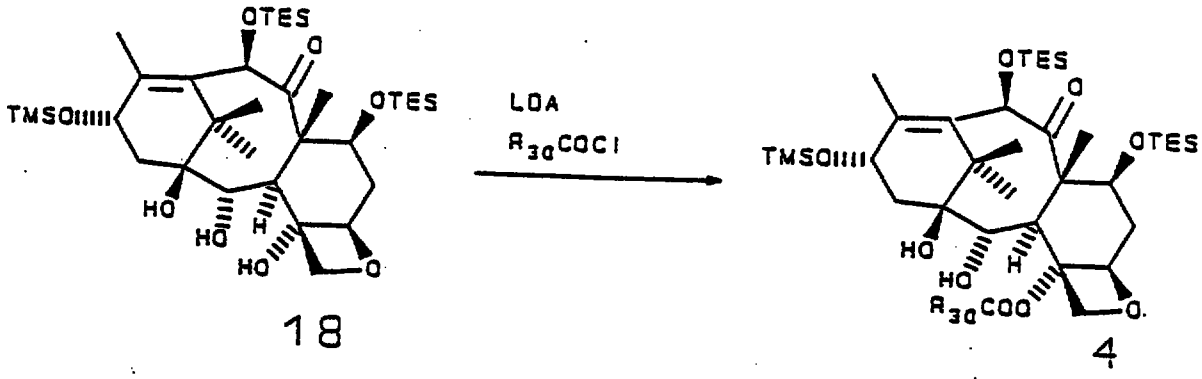

Deprotonation of triol 18 with LDA followed by introduction of an acid chloride selectively gives the C4 ester. For example, when acetyl chloride was used, triol 18 was converted to 1,2 diol 4 as set forth in Reaction Scheme 7.

Triol 18 can also readily be converted to the 1,2 carbonate 19. Acetylation of carbonate 19 under vigorous standard conditions provides carbonate 21 as described in Reaction Scheme 8; addition of alkyllithiums or Grignard reagents to carbonate 19 provides the C2

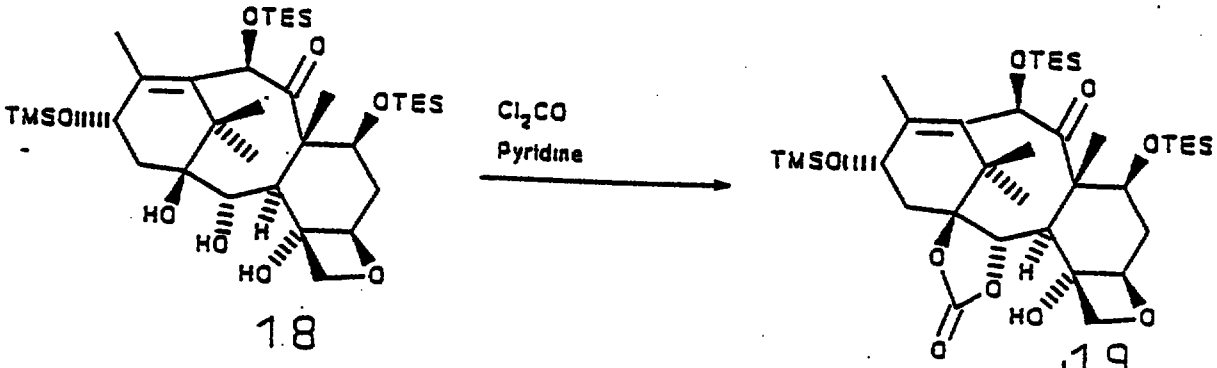

ester having a free hydroxyl group at C4 as set forth in Reaction Scheme 6.

Scheme 7

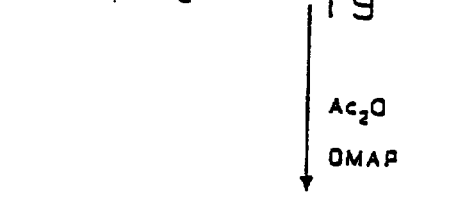

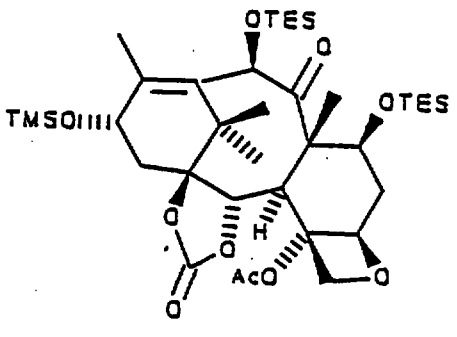

18 4

Scheme 8

18 19

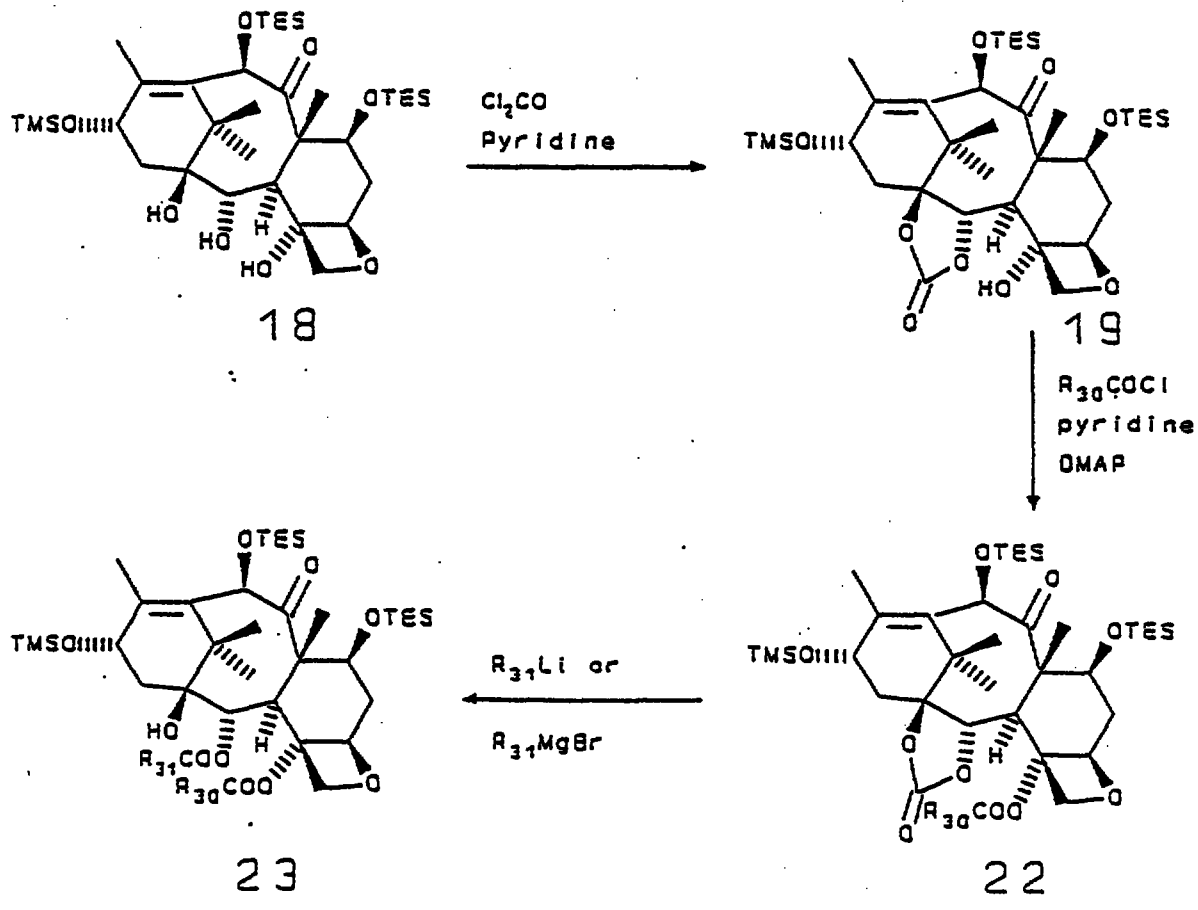

21

As set forth in Reaction Scheme 9, other C4 substituents can be provided by reacting carbonate 19 with an acid chloride and a tertiary amine to yield carbonate 22 which is then reacted with alkyllithiums or Grignard reagents to provide 10-DAB derivatives having new substituents at C2.

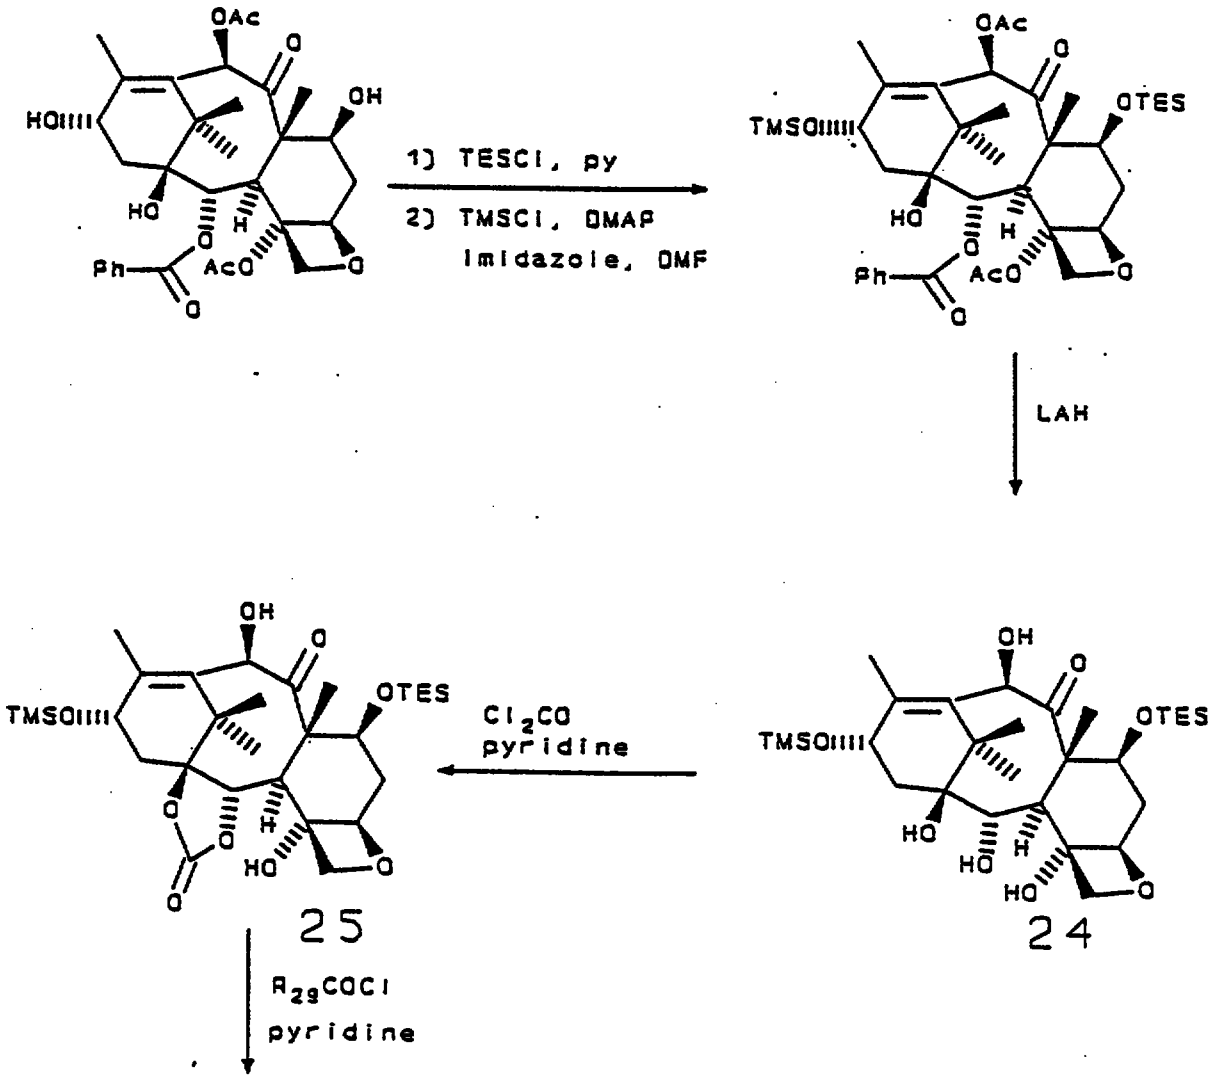

Scheme 9

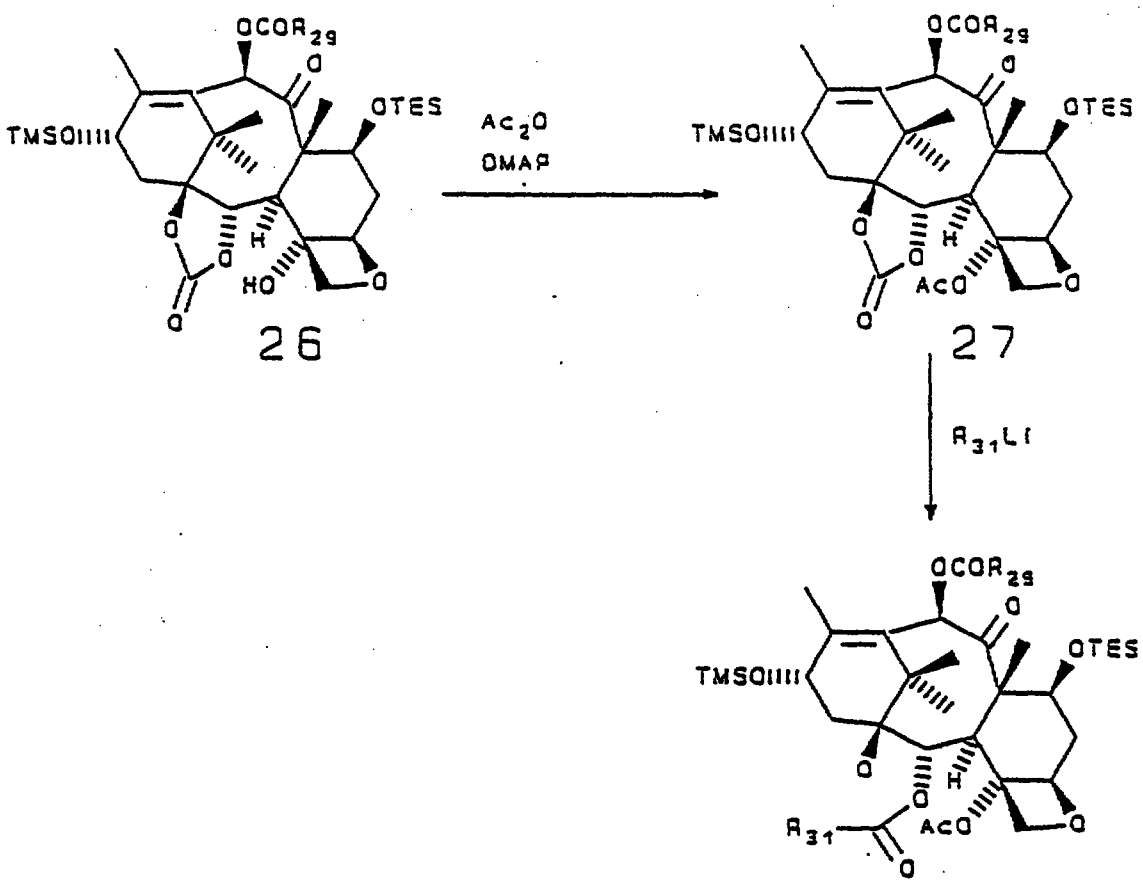

Alternatively, baccatin III may be used as a starting material and reacted as shown in Reaction Scheme 10. After being protected at C7 and C13, baccatin III is reduced with LAH to produce 1,2,4,10 tetraol 24. Tetraol 24 is converted to carbonate 25 using Cl_2CO and pyridine, and carbonate 25 is acylated at C10 with an acid chloride

and pyridine to produce carbonate 26 (as shown) or with acetic anhydride and pyridine (not shown). Acetylation of carbonate 26 under vigorous standard conditions provides carbonate 27 which is then reacted with alkyl lithiums to provide the baccatin III derivatives having new substituents at C2 and C10.

Scheme 10

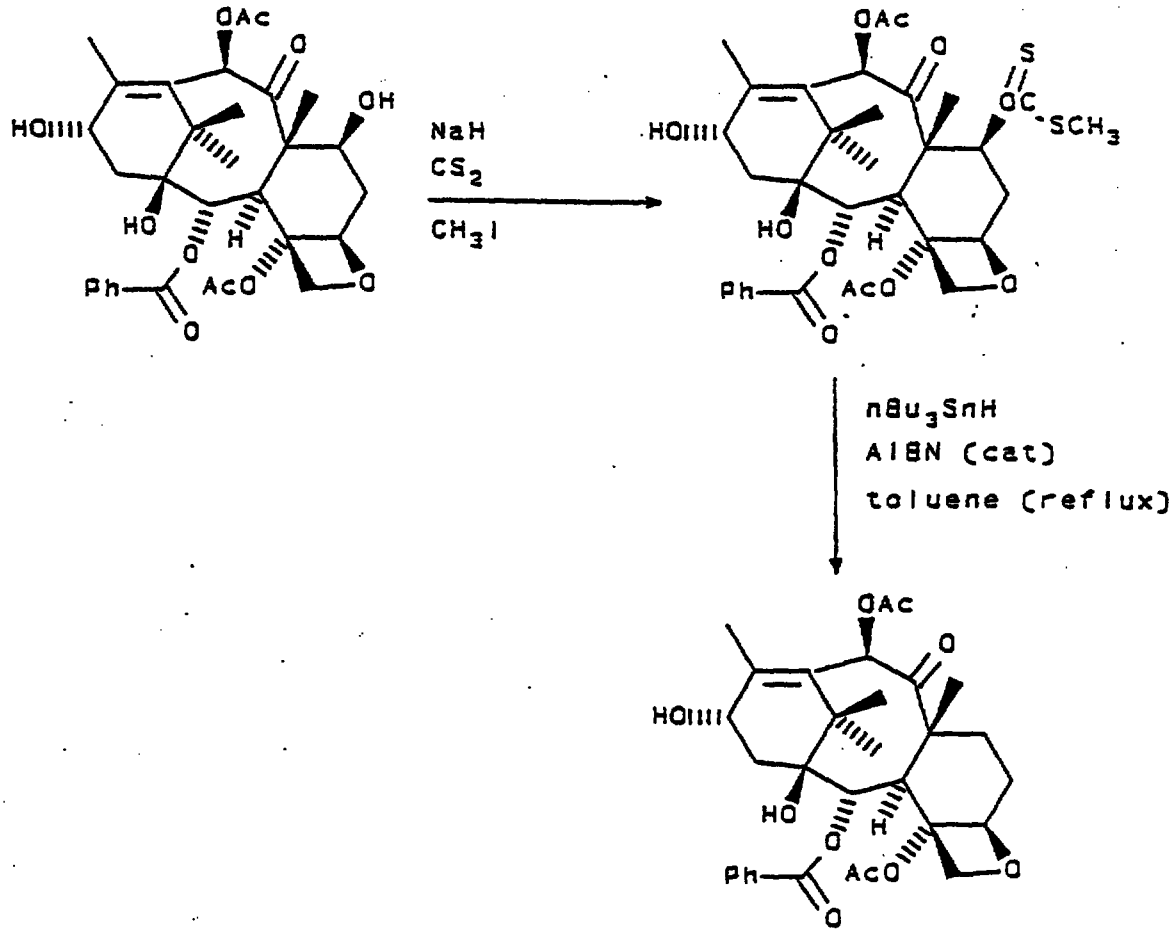

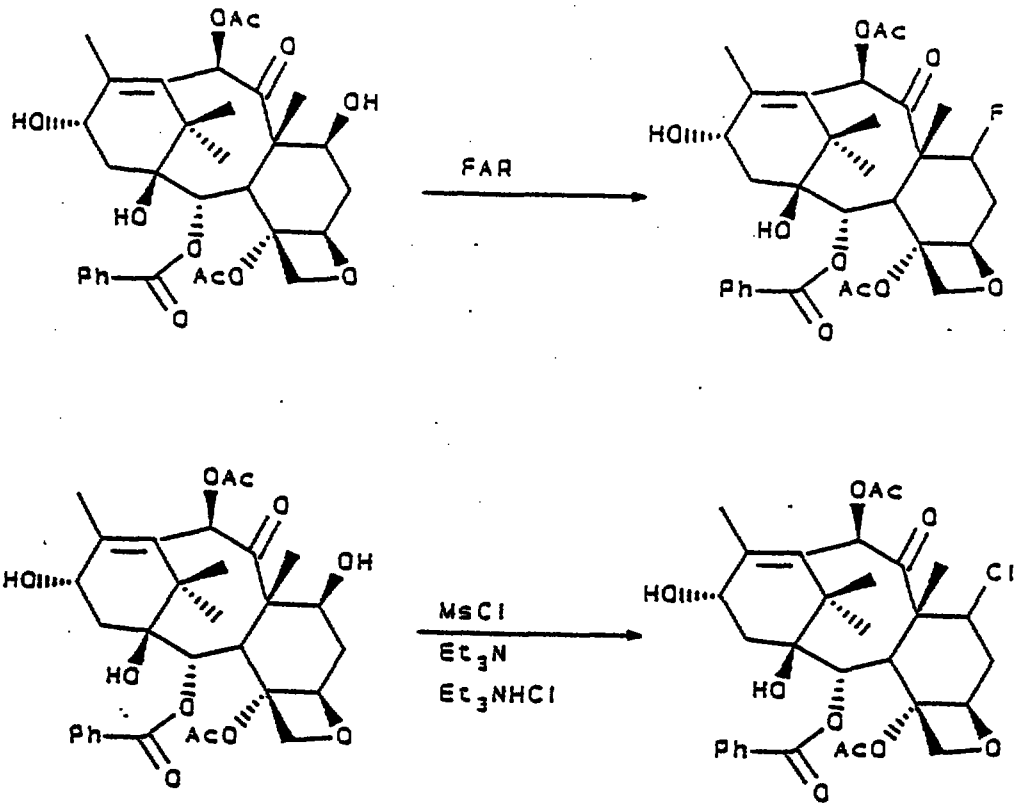

10-desacetoxy derivatives of baccatin III and 10-desoxy derivatives of 10-DAB may be prepared by reacting baccatin III or 10-DAB (or their derivatives) with samarium diiodide. Reaction between the tetracyclic taxane having a C10 leaving group and samarium diiodide may be carried out at 0°C in a solvent such as tetrahydrofuran. Advantageously, the samarium diiodide selectively abstracts the C10 leaving group; C13 side chains and other substituents on the tetracyclic nucleus remain undisturbed. Thereafter, the C9 keto substituent may be reduced to provide the corresponding 9-desoxo-9β-hydroxy-10-desacetyoxy or 10-desoxy derivatives as otherwise described herein.

C7 dihydro and other C7 substituted taxanes can be prepared as set forth in Reaction Schemes 11, 12 and 12a.

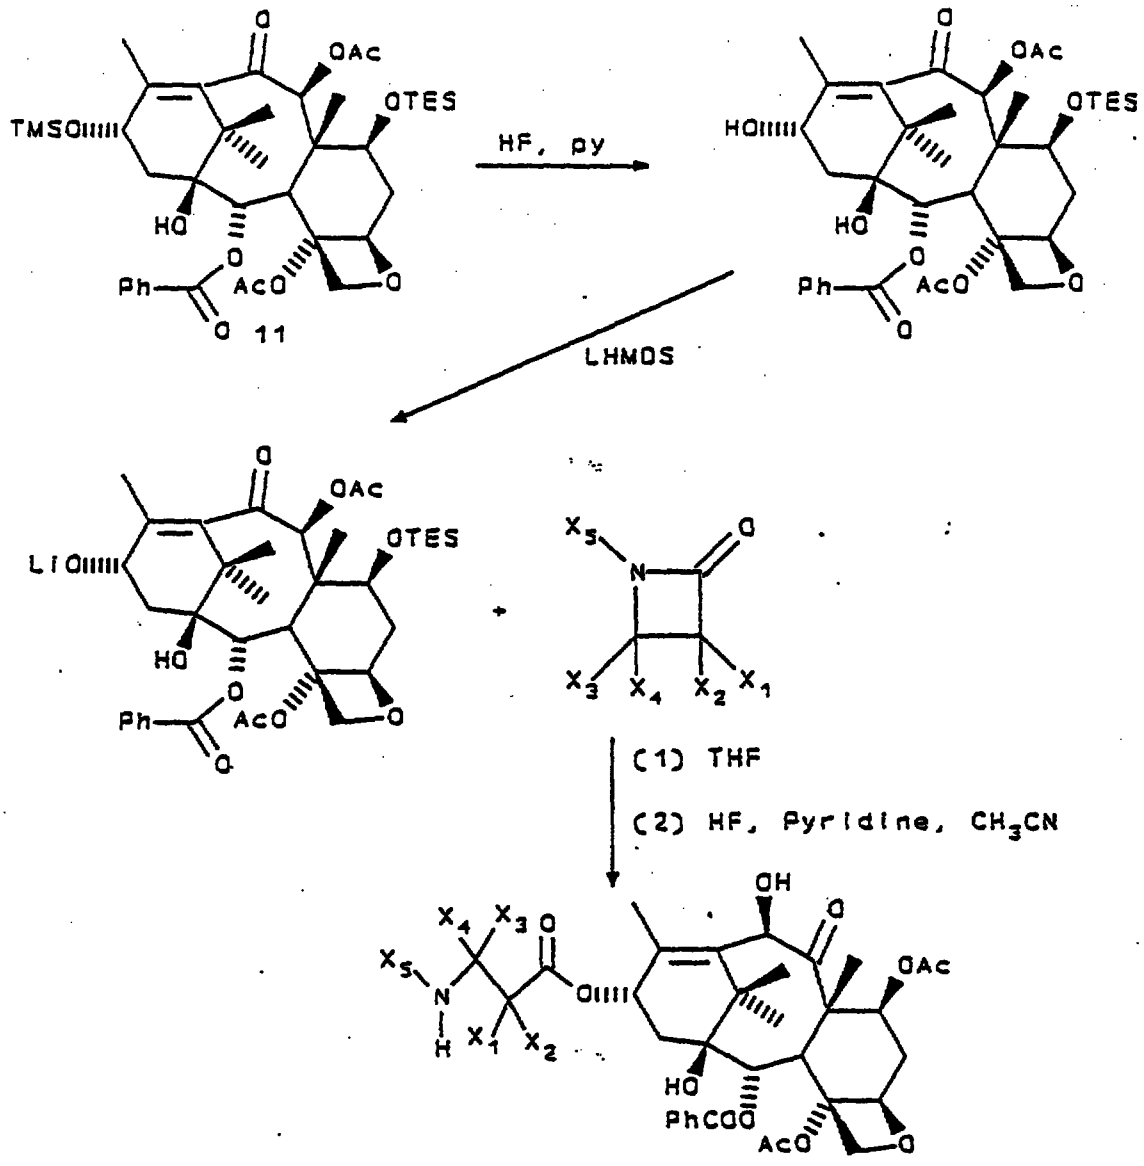

REACTION SCHEME 11

REACTION SCHEME 12

REACTION SCHEME 12a

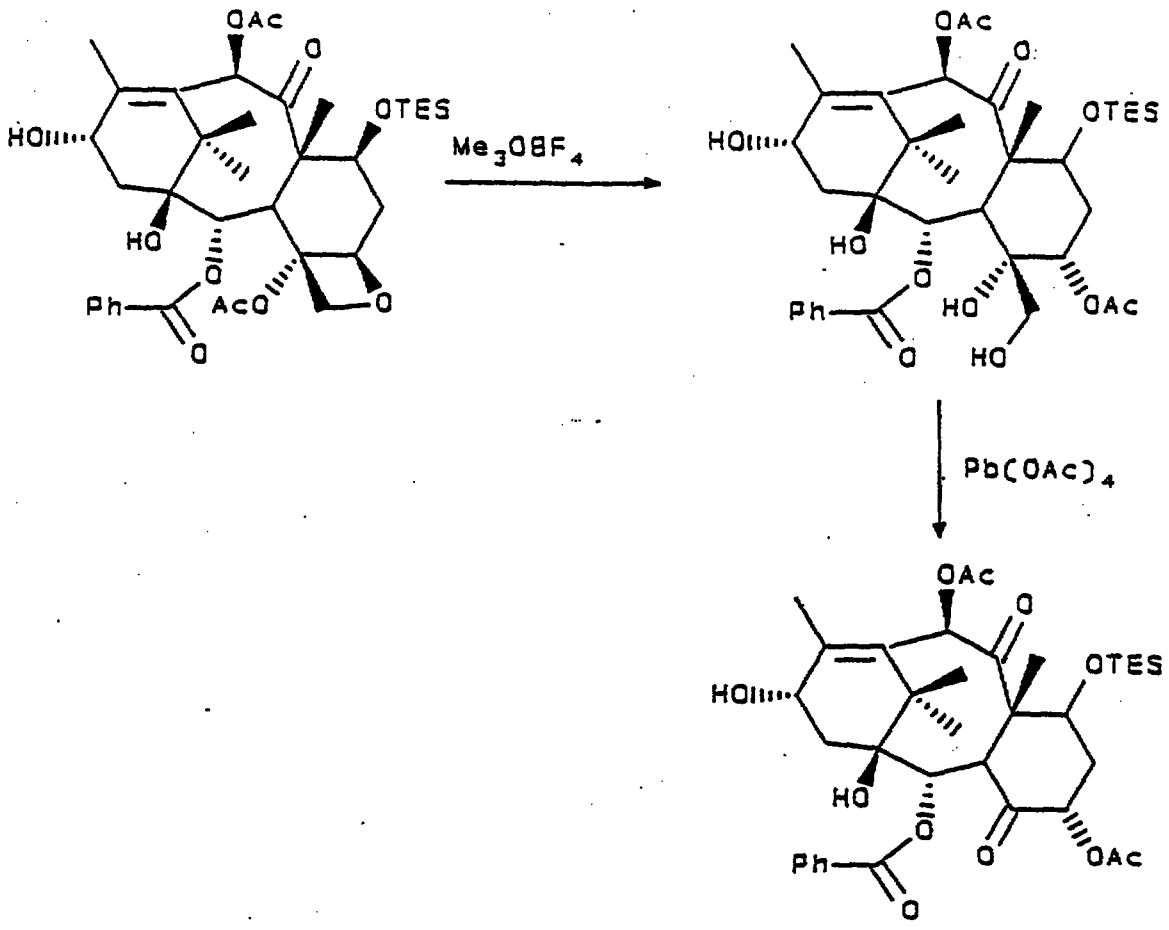

As shown in Reaction Scheme 12, Baccatin III may be converted into 7-fluoro baccatin III by treatment with FAR at room temperature in THF solution. Other baccatin derivatives with a free C7 hydroxyl group behave similarly. Alternatively, 7-chloro baccatin III can be prepared by treatment of baccatin III with methane sulfonyl chloride and triethylamine in methylene chloride solution containing an excess of triethylamine hydrochloride.

Taxanes having C7 acyloxy substituents can be prepared as set forth in Reaction Scheme 12a, 7,13-protected 10-oxo-derivative 11 is converted to its corresponding C13 alkoxide by selectively removing the C13 protecting group and replacing it with a metal such as lithium. The alkoxide is then reacted with a β-lactam or other side chain precursor. Subsequent hydrolysis of the C7 protecting groups causes a migration of the C7 hydroxy substituent to C10, migration of the C10 oxo substituent to C9, and migration of the C9 acyloxy substituent to C7.

As shown in Reaction Scheme 13, 7-O-triethylsilyl baccatin III can be converted to a tricyclic taxane through the action of trimethyloxonium tetrafluoroborate in methylene chloride solution. The product diol then reacts with lead tetraacetate to provide the corresponding C4 ketone.

REACTION SCHEME 13

The subprocesses of Reaction scheme A can be applied at various stages. For example, the process for the conversion of compound 30 to compound 33 can be applied to any intermediate having a hydroxyl group at C-10 and two hydrogens at C-9, e.g., the process for introducing C9 and C10 carbonyl and hydroxyl groups can be applied to suitably protected intermediates 4 through 29.

Likewise, the process for introduction of C1 and C2 oxygen-containing functional groups (conversion of 6 to 13 in Reaction Scheme A) can be applied to any intermediate having a C3 carbonyl group.

Similarly, the process for introducing C2 and C4 acyl groups as exemplified in Reaction Schemes 6 through 10 can be applied to any intermediate having a C1, C2 carbonate.

Also, the process for forming the oxetane ring, as exemplified in the conversion of 24a to 27a in Reaction Scheme A, can be applied to a variety of intermediates having a C4 carbonyl group.

The aldol process exemplified in the conversion of 5 to 6 in Reaction Scheme A can be applied to any suitably protected intermediate having a C3 carbonyl group and a C8a hydrogen. A variety of ketones or aldehydes can be used as a reactant in this process.

Formation of a cyclic carbonate from any 1,2 or 1,3 diol subunit in any intermediate can be carried out by using phosgene as a reactant. Carbonyl groups can be reduced by hydride reagents or metallic species to the corresponding alcohols. Alcohols can be oxidized using a variety of oxidizing agents as exemplified in the Reaction Schemes, to the corresponding carbonyl groups.

The compounds disclosed in this application have several asymmetric carbons and may exist in diastereomeric, racemic, or optically active forms. All of these forms are contemplated within the scope of this invention. More specifically, the present invention includes the enantiomers, diasteriomers, racemic mixtures, and other mixtures of the compounds disclosed herein.

The following examples illustrate the invention.

EXAMPLES

REACTION SCHEME A

Triethylsilyloxy alcohol 3 . To a solution of diol 2 (3.16 g, 13.4 mmol) and DMAP (70 mg, 0.57 mmol) in CH_2Cl_2 (65 mL) at room temperature was added triethylamine (3.7 mL, 26.6 mmol) followed by dropwise addition of TESCl (2.7 mL, 16.1 mmol). After 1.75 h, the reaction mixture was diluted with 150 mL of hexane, then poured into 100 mL of a saturated aqueous $NaHCO_3$ solution and 150 mL of hexane. The organic phase was washed with two 100 mL portions of saturated aqueous $NaHCO_3$ solution and with 100 mL of water, dried over anhydrous Na_2SO_4, and concentrated under reduced pressure to give 4.88 g of crude triethylsilyloxyalcohol 3. An analytical sample was obtained by plug filtration through a short pad of silica gel washing with hexane and then eluting the pure compound 3 (P_{10} = TES) (colorless oil) with 5% ethyl acetate in hexane.

3 (P_{10} = TES): ^{1}H NMR (300 MHz, $CDCl_3$) δ 0.61 (q, J = 7.7 Hz, 6H, TES CH_2), 0.89 (s, 3H, CH_3 16), 0.96 (t, J = 7.7 Hz, 9H, TES CH_3), 1.03 (d, J = 7.1 Hz, 3H, CH_3 19), 1.07 (s, 3H, CH_3 17), 1.23 (d, J = 14.3 Hz, 1H, H2α), 1.56 (dd, J = 6.0, 6.0 Hz, 1H, H7), 1.76 (ddd, J = 5.0, 11.0, 13.7 Hz, 1H, H9), 1.90 (ddd, J = 2.2, 8.8, 15.4 Hz, 1H, H9), 1.96 (m, 1H, H14α), 2.37 (m, 2H, H2β, H14β), 2.51 (ddd, J = 7.7, 7.7, 10.4 Hz, 1H, H8α), 2.94 (s, 1H, OH-3), 4.21 (dd, J = 2.2, 5.0 Hz, 1H, H10), 5.43 (dd, J = 2.8, 2.8 Hz, 1H, H13). ^{13}C NMR (75 MHz, $CDCl_3$) δ (ppm) 4.8 (TES CH_2), 6.7 (TES CH_3), 15.02 (CH_3 19), 23.0 (CH_3 17), 26.2 (CH_3 18), 28.0 (CH_3 16), 33.6 (C14), 41.5 (C8), 44.2 (C2), 45.0 (C1), 45.2 (C15), 45.8 (C9), 69.6 (C11), 74.9 (C10), 96.0 (C3), 123.0 (C13), 143.7 (C12); IR ($CHCl_3$) υ 3530, 2970, 2930, 2900, 1460, 1340, 1140, 1100, 1080, 1045, 1010, 970, 915, 650 cm^{-1}; MS (CI) 351 (M+1, 58), 333 (100), 219 (34).

Hydroxy Ketone 4. To a vigorously stirred solution of the crude compound 3 (P_{10} = TES) in anhydrous CH_2Cl_2 (30 mL) at 0 °C under nitrogen was added Ti (O^iPr)$_4$ (13.5 mL, 43.1 mmol) followed by dropwise addition of anhydrous 2M ^{t}-BuOOH in hexane (18 mL, 36 mmol). After 45 min dimethylsulfide (15 mL) was added slowly over a period of 5 min. The solution was stirred for 10 min at 0 °C, then 15 min at room temperature and then moved to a 55 °C bath where it was

heated under reflux for 8h. The solvents were evaporated under reduced pressure, the resulting thick syrup was dissolved in ethyl acetate (850 mL) and 3.5 mL if H_2O was added dropwise with vigorous stirring. The resulting mixture was stirred at room temperature for 1h and then filtered through a pad of Celite which was further washed with two portions of 100mL of ethyl acetate. Evaporation of the solvent under reduced presure afforded an oil that was filtered through a short pad of silica gel eluting eith 10% ethyl acetate in hexane to give 4.78g of pure hydrowyketone 4 (P_{10}=TES) (colourless oil).

Ketone 5. To a solution of hydroxyketone 4 (P_{10} = TES) in anhydrous pyridine (25 mL) at -23 °C under nitrogen was added dropwise TBSOTf (3.2 mL, 13.9 mmol). After 5 min, the flask was moved to an ice bath and stirred for 1.75 h. The solution was diluted with 75 mL of hexane at 0 °C and then decanted from the insoluble oil into saturated aqueous $NaHCO_3$ solution (200 mL). The remaining oil was extracted with three 75 mL portions of hexane. The combined organic phases were washed with two 50 mL portions of saturated aqueous $NaHCO_3$ solution and then with 50 mL of water, dried over anhydrous Na_2SO_4 and concentrated under reduced pressure. The yellowish oily residue was purified by filtration through a short pad of silica gel eluting with 10% ethyl acetate in hexane to give 4.78 g of pure ketone 5 (P_{10} = TES, P_{13} = TBS) (94% yield from 2).

Ketocarbonate 6. To a stirred solution of diisopropylamine (0.60 mL, 4.28 mmol) in THF (11 mL) under nitrogen at room temperature was added 1.26 mL of a 3.1 M solution (3.89 mmol) of MeMgBr in ether. After 3 h, a solution of ketone 5 (P_{10} = TES, P_{13} = TBS) (750 mg, 1.56 mmol) in THF (3.5 mL) was added dropwise at room temperature. After 1.5 h, the reaction mixture was cooled to -23 °C and a solution of 4-pentenal (327 mg, 3.89 mmol) in THF (4 mL) was added dropwise down the side of the flask. After 1 h, 10 mL of a saturated aqueous NH_4Cl solution was added. Ater 2 min, the reaction mixture was diluted with 100 mL of hexane, then poured into 100 mL of H_2O. The organic phase was washed with 100 mL of H_2O and 100 mL of brine, and dried over anhydrous Na_2SO_4 and concentrated under reduced pressure to give 0.92 g of a yellow oil. To a solution of the crude mixture in CH_2Cl_2 (10 mL) and pyridine (10 mL) under nitrogen at -23 °C was added 2.3 mL of 4 M solution (9.36 mmol) of phosgene in toluene dropwise and the reaction mixture was warmed to -10 °C. After 30 min, ethanol (3.7 mL) was added and the resulting mixture was stirred for 30 min. The reaction mixture was then diluted with 300 mL of hexane, washed with 200 mL of a saturated aqueous $NaHCO_3$ solution, 200 mL of a

10 % aqueous $CuSO_4$ solution, 200 mL of H_2O, 200 mL of a saturated aqueous $NaHCO_3$ solution and 200 mL of brine, dried over anhydrous Na_2SO_4 and concentrated under reduced pressure to give 1.05 g of a yellow solid. The crude mixture was filtered through silica gel with 10% ethyl acetate in hexanes to give 965 mg of a white solid which was further purified by silica gel chromatography eluting with 2% ethyl acetate in hexanes to yield 745 mg (75 %) of ketocarbonate 6 (P_{10} = TES, P_{13} = TBS, R = Et) as a white solid. The product was isolated as a 6:1 ratio of conformational isomers. The following NMR data is for the predominant conformer.

Hydroxyketone 7. To a stirred solution of ketocarbonate 6 (P_{10} = TES, P_{13} = TBS, R = Et) (4.00 g, 6.28 mmol) in THF (65 mL) under nitrogen at -35 °C was added 50 mL of a 0.2 M solution (10 mmol) of LDA in THF down the side of the flask over a 10 min period. After 30 min, the reaction mixture was cooled to -78 °C and 2.29 g of (R)-camphorylsulfonyl oxaziridine (10 mmol) in THF (18 mL) was added dropwise down the side of the flask. After 30 min, the reaction mixture was

quenched with 300 mL of a saturated aqueous $NaHCO_3$ solution and extracted with 500 mL and then 150 mL of 25% ethyl acetate in hexanes. The combined organic phases were washed with brine, dried over anhydrous Na_2SO_4 and concentrated under reduced pressure to yield 7 g of a waxy solid. This material was purified by flash chromatography, eluting with 3% ethyl acetate in hexanes to yield 3.50 g of hydroxyketone 7 (P_{10} = TES, P_{13} = TBS, R = Et) (85%).

Hydroxycarbonate 8. To a vigorously stirred solution of hydroxyketone 7 (P_{10} = TES, P_{13} = TBS, R = Et) (2.69 g, 4.12 mmol) in toluene (117 mL) under nitrogen at -78 °C was added dropwise down the side of the flask 85 mL of a 0.97 M solution (82.4 mmol) of RedAl in toluene. After 6 h at -78 °C, the solution was allowed to gradually warm to room temperature over a period of 6 h. The mixture was recooled to -10 °C and 125 mL of a 2 M solution (250 mmol) of acetic acid in THF was added dropwise down the side of the flask. The cloudy mixture was stirred 10

min then poured into 1200 mL of 50% ethyl acetate in hexanes and washed with 1 L of a saturated aqueous $NaHCO_3$ solution. The aqueous phase was extracted with four 500 mL portions of ethyl acetate and the combined organic phases were washed with brine, dried over anhydrous Na_2SO_4 and concentrated under reduced pressure to yield 2.29 g of 2,3,7-triol as a white solid. This material was used without further purification.

To a vigorously stirred solution of triol (2.29 g, 3.93 mmol) in CH_2Cl_2 (157 mL) and pyridine (15.7 mL) under nitrogen at -78 °C was quickly added 7.6 mL of a 3.0 M solution (23 mmol) of phosgene in toluene. The solution was allowed to warm to room temperature over a period of 1 h then poured into 250 mL of ethyl acetate, washed with two 125 mL portions of a saturated aqueous $NaHCO_3$ solution and 100 mL brine, dried over anhydrous Na_2SO_4 and concentrated under reduced pressure to yield 2.52 g yellow oil. This material was filtered through a 2 inch (5.08 cm) pad of silica gel with 50% ethyl acetate in hexanes and concentration under reduced pressure yielded 2.39 g (95% from 7) of hydroxy carbonate 8 (P_{10} = TES, P_{13} = TBS) as a white solid.

Keto Lactone 11. To the 2-keto-3-hydroxylactone 10 (P_{10} = TES, P_{13} = TBS) (1.10 g, 1.83 mmol) was added a 0.1 M solution of SmI_2 in THF (82 mL, 8.2 mmol). The resulting dark blue solution was stirred at room temperature under N_2 for 4h. After cooling to 0 °C an ethereal solution of HCl (0.66M; 4.2 mL, 2.77 mmol) was added; after 5 min the flask was opened to the air and the reaction mixture was diluted with 200 mL of cold ethyl acetate, then poured into 50 mL of ice cold 0.2N aqueous HCl. The organic phase was separated and washed with 50 mL of a 5% aqueous citric acid solution, two 50 mL portions of a saturated aqueous $NaHCO_3$ solution and 50 mL of brine, dried over anhydrous Na_2SO_4 and concentrated under reduced pressure. The resulting material was dissolved in 100 mL of hexanes, then silica gel (230-400 mesh; 4.3 g) was added and the mixture was vigorously stirred at room temperature for 65 min before filtering through a 1 inch (2.54 cm) pad of silica gel eluting with 300mL of 20% ethyl acetate in hexanes. The solvent was evaporated under reduced pressure and the residue was purified by silica gel chromatography, eluting with 10% ethyl acetate in hexanes to yield 822mg (77%) of the cis-ketolactone 11 and 164mg (15%) of the corresponding trans isomer.

To a solution of the *trans*-2-ketolactone (611 mg, 1.03 mmol) stirred in 10 mL of THF under nitrogen at 0 °C was added down the side of the flask 6.8 mL of a 0.6 M solution (4.1 mmol) of t-BuOK in THF. The resulting solution was stirred for 1.5 h then 10 mL of a 10% acetic acid solution in THF was added down the side of the flask. After stirring for 5 min the mixture was diluted with 200 mL of hexanes and poured into 100 mL of a saturated aqueous $NaHCO_3$ solution. The organic layer was washed with water and brine then dried over anhydrous Na_2SO_4 and concentrated under reduced pressure to yield 615 mg of pale brown oil. The oil was dissolved in 10 mL of hexanes and silica gel (3.0 g) was added. The mixture was stirred vigorously for 15 min then filtered through a 1/2 inch (1.27cm) plug of silica gel with 20% ethyl acetate in hexanes. Concentration of the filtrate under reduced pressure yielded 576mg of pale yellow oil. This material was purified by silica gel chromatography, eluting with 10% then 20% ethyl acetate in hexanes to yield 472mg (77%) of pure cis-2-ketolactone 11 (P_{10} = TES, P_{13} = TBS), 84mg (13%) of pure trans isomer and 24mg of a 6:1 mixture of cis:trans isomers.

1,2-Dihydroxy-trans-lactone 13. To a stirred 1.23 M solution of Red-Al (4.6 mmol, 5.6 mmol) in THF under nitrogen at -78 °C was quickly added a solution of *cis*-hydroxyketone 12 (P_{10} = TES, P_{13} = TBS) (342 mg, 0.563 mmol) in THF (25 mL). After 1.5 h, 25 mL of a 15 % aqueous NaOH solution was added dropwise directly to the reaction mixture. The reaction mixture was vigorously stirred at room temperature for 3 h and was then poured into 100 mL of H_2O and extracted with two 100 mL portions of ether. The organic phases were combined and washed with 100 mL of H_2O and 100 mL of brine, dried over anhydrous Na_2SO_4 and concentrated under reduced pressure to give 0.35 g of a pale yellow solid. This material was purified by silica gel chromatography eluting with 10% ether in hexanes followed by 25% ethyl acetate in hexanes to yield 290 mg *trans*-diol 13 as colorless needles, 14.5 mg (4.2 %) of trans-hydroxyketone, and 20 mg of a mixture of *cis*-diol and unknown byproducts. To a solution of the mixture containing *cis*-

diol in THF (1 mL) under nitrogen at room temperature was added 0.5 mL a 30% aqueous solution of NaOH. After 2.5 h, the reaction mixture was poured into 30 mL of H_2O and extracted with 30 mL of ether. The organic phase was washed with 30 mL of H_2O and 30 mL of brine, dried over anhydrous Na_2SO_4 and concentrated under reduced pressure to give 0.02 g of a yellow solid, which was purified by silica gel chromatography eluting with 5% ethyl acetate in hexanes to yield an additional 12 mg (total yield: 302 mg, 88%) of *trans*-diol 13 (P_{10} = TES, P_{13} = TBS).

Hydroxy olefin 24a. To a refluxing solution of alcohol 23a (P_7 = BOM, P_{10} = TES, P_{13} = TBS, P_5 = TMS) (46.7 mg, 0.055 mmol) in toluene (1.1 mL) was added 1.1 mL of a 0.1M solution of Burgess reagent in toluene (0.11 mmol). The mixture was refluxed for 20 min then cooled to room temperature, diluted with ethyl acetate, washed with a saturated solution of $NaHCO_3$ and brine, dried over anhydrous Na_2SO_4 and filtered. Concentration of the filtrate under vacuum yielded 46 mg of crude olefin. This material was used without further purification.

To a stirred solution of this crude olefin (46 mg, 0.055 mmol) in acetonitrile (2.5 mL) at 0 °C was added 2.5 mL of a 1:10:10 (by volume) mixture of 48% aqueous HF : pyridine : acetonitrile. The

mixture was stirred at 0 °C for 20 min, quenched with a saturated solution of $NaHCO_3$ and extracted twice with ethyl acetate. The combined organic phases were washed with brine, dried over anhydrous Na_2SO_4 and filtered. Concentration of the filtrate under vacuum yielded 48 mg of a colorless oil which was purified by silica gel chromatography to yield 25.9 mg (62%) of hydroxy olefin 24a (P_7 = BOM, P_{10} = TES, P_{13} = TBS, R = H) as well as 2.1 mg of unreacted alcohol 23a (4%).

Alcohol 31 through Alcohol 30a. To a stirred solution of oxetane 29 (P_7 = BOM, P_{10} = TES, P_{13} = TBS) (16 mg, 0.02 mmole) in acetonitrile (0.33 mL) at 0 °C was added a 4% solution of HF-pyridine complex in acetonitrile (0.8 mL). The solution was stirred at 0 °C for 11 h, diluted with ethyl acetate, poured into 20 mL of a saturated aqueous $NaHCO_3$ solution and extracted with $CHCl_3$ (30 mL x 3). The combined organic phases were dried over anhydrous Na_2SO_4 and concentrated under reduced pressure to give 13.5 mg (0.0196 mmole) of 30a as an oil. This oil was dissolved in THF (1 mL) and cooled to -78 °C. To this solution at -78 °C was added a 0.285 M solution of phenyllithium in THF (0.144 mL, 2.1 eq.). After 10 min, the solution was poured into 20 mL of saturated aqueous $NaHCO_3$ solution and $CHCl_3$ (30 mL x 3). The combined organic phase was dried over anhydrous Na_2SO_4 and concentrated under reduced pressure to give 16 mg of a pale yellow oil, which was crystalized to yield 12.7 mg (85%) of benzoate 31 (P_7 = BOM, P_{13} = TBS, R = H).

Ketone 32. To a solution of benzoate 31 (P_7 = BOM, P_{13} = TBS, R = H) (18 mg, 0.235 mmole) and 4-methylmorpholine N-oxide (18 mg, 0.154 mmole) in CH_2Cl_2 (2.6 mL) at room temperature was added tetrapropylammonium perruthenate (6 mg, 0.017 mmole). The solution was stirred at room temperature for 15 min and filtered through silica gel with 30 % ethyl acetate/hexane. The filtrate was concentrated under reduced pressure to yield ketobenzoate 32 (P_7 = BOM, P_{13} = TBS) (18 mg, 100%).

Hydroxyketone 33. To a THF (1.3 mL) solution of 32 (P_7 = BOM, P_{13} = TBS) (16.2 mg, 0.02 mmol) at -78 °C was added 4 equivalents of a 0.24M *t*-BuOK solution in THF (0.33 mL, 0.08 mmol.). The solution was warmed to -20 °C for 40 min and then briefly warmed to 0°C before being cannulated into a 0°C THF (1.3 mL) suspension of benzeneseleninic anhydride (57 mg, 0.16 mmol.). The reaction was stirred for 40 min. at 0 °C before being diluted with 20 mL of ethyl acetate and poured into 50 mL of aqueous saturated $NaHCO_3$. The organic layer was then washed with 50 mL of aqueous saturated $Na_2S_2O_3$ followed by 50 mL of aqueous saturated $NaHCO_3$. The organic layer was then dried with Na_2SO_4, filtered and evaporated to give 18.8 mg of the hydroxyketone as an oil. To a THF (1.3 mL) solution of the crude hydroxyketone (18.8 mg) was

added 0.33 mL of a 0.24M solution of *t*-BuOK (0.08 mmol) at -78 °C. The reaction was stirred 20 min. and then 0.25 mL of a 0.8M AcOH/THF solution was added at -78 °C and stirred 5 min. The mixture was diluted with 20 mL of ethyl acetate and was poured into 50 mL of aqueous saturated $NaHCO_3$. The organic layer was then dried with Na_2SO_4, filtered and evaporated to give 18.6 mg of a yellow solid which was then plug filtered through silica gel with 2% ethyl acetate/hexanes followed by 30% ethyl acetate/hexanes to give 15.9 mg of 33 (P_7 = BOM, P_{13} = TBS) (96% yield).

Diol 35. A solution of 34 (P_7 = BOM, P_{13} = TBS) (16.3 mg, 0.0199 mmol) in THF (0.5 mL) was added to tris(diethylamino)sulfoniumdifluorotrimethylsilicate (TASF) (37 mg, 0.134 mmole) at room temperature under nitrogen atmosphere. The solution was stirred for 40 min, diluted with ethyl acetate, poured into 20 mL of a saturated aqueous $NaHCO_3$ solution and extacted with $CHCl_3$ (30 mL x 3). The combined organic phase was dried over anhydrous Na_2SO_4 and concentrated under reduced pressure to give 16 mg of a pale yellow oil, which was filtered through a pad of silica gel using 70 % ethyl acetate/hexane as eluent. The filtrate was concentrated to yield 13.5 mg (94 %) of 7-BOM BIII (35).

7-BOM-Taxol. To a solution of 7-BOM baccatin III (35) (13.2 mg, 0.018 mmol) in 0.25 mL of THF at -45 °C was added dropwise 21 μL of a 1.03 M solution of lithium bis(trimethylsilyl)amide in THF. After 1h at -45 °C, a solution of (S)-*cis*-1-benzoyl-3-triethylsilyloxy-4-azetidin-2-one (15

mg, 0.039 mmol) in 0.25 mL of THF was added dropwise to the mixture. The solution was warmed to 0 °C and kept at that temperature for 1 h before 0.2 mL of a 10% solution of AcOH in THF was added. The mixture was partitioned between saturated aqueous $NaHCO_3$ and 60% ethyl acetate / hexane. Evaporation of the organic layer gave a residue which was purified by filtration through silica gel to give 20.2 mg of crude (2'R,3'S)-2'-triethylsilyl-7-BOM taxol.

To a solution of 20.2 mg (0.018 mmol) of (2'R,3'S)-2'-triethylsilyl-7-BOM taxol in 0.8 mL of acetonitrile and 0.3 mL of pyridine at 0 °C was added 0.10 mL of 48% aqueous HF. REACTION SCHEME A'

Hydroxyketone 19. To a vigorously stirred solution of ketone 18 (P_7=MOP) (181 mg, 0.265 mmol) in THF (2.2 mL) under nitrogen at -78 °C was added dropwise down the side of the flask 2.13 mL of a 0.2 M solution (0.426 mmol) of LDA in THF. After 10 min, a solution of 116 mg of (S)-camphorsulfonyloxaziridine (116 mg, 0.396 mmol) in 1.5 mL THF was added dropwise down the side of the flask. The reaction mixture was cooled to -40 °C and, after stirring 1 h, 2 mL of a saturated aqueous $NaHCO_3$ solution was added. The reaction mixture was diluted with 50 mL of 30% ethyl acetate in hexanes and washed with 20 mL of a saturated aqueous $NaHCO_3$ solution and brine, dried over anhydrous Na_2SO_4 and concentrated under reduced pressure. The resulting oil was filtered through silica gel with 30% ethyl acetate in hexanes and concentrated to give 210 mg of a colorless oil. This material was purified by radial chromatography, eluting with 25% ethyl acetate in hexanes to yield 150 mg (81%) 5β-hydroxyketone 19 as a white solid, 15 mg (8%) returned starting ketone 18 and 10 mg (5%) of the corresponding 5α-hydroxyketone.

Diol 21. To a stirred solution of ketone 20 (P_7=MOP) (453 mg, 0.588 mmol) in THF (23 mL) under nitrogen at -78 °C was added dropwise 1.95 mL of a 3 M solution of MeMgBr in ether (5.85 mmol). The reaction mixture was stirred for 5.5 h, poured into 100 mL of a saturated aqueous $NaHCO_3$ solution and extracted with three 100 mL portions of $CHCl_3$. The combined organic phases were dried over anhydrous Na_2SO_4 and concentrated under reduced pressure to yield 453 mg of the hydroxy trimethylsilyl ether as a colorless oil. This material was used without further purification.

To a stirred solution of the trimethylsilyl ether (453 mg) in pyridine (8 mL) and acetonitrile (8 mL) at 0 °C was added 0.8 mL of a 48% aqueous HF solution. After stirring 20 min, the resulting mixture was poured into 100 mL of a saturated aqueous $NaHCO_3$ solution and extracted with three 150 mL portions of $CHCl_3$. The combined organic layers were dried over anhydrous Na_2SO_4 and concentrated under reduced pressure to yield 422 mg of diol 21. This material was used without further purification.

Acetonide 26b. To a solution of the *p*-methoxybenzylidene acetal 25b (P_5=Ac, P_7=BOM) (11.5 mg, 0.012 mmol) in 0.4 mL of toluene stirred at 0 °C was added a solution of diisobutylaluminum hydride (0.082 ml, 2.0M in toluene, 0.12 mmol). The resulting solution was stirred for 3.5 h then methanol (0.1 ml) was added. The mixture was diluted with ethyl acetate (5 ml) and stirred with saturated aqueous sodium potassium tartrate for 1.5 hours. The aqueous phase was separated and extracted with ethyl acetate (2 x 10 ml) then the combined extracts were washed with brine and dried with Na_2SO_4. Filtration followed by concentration of the filtrate under vacuum yielded 12 mg of crude material that was purified by silica gel chromatography (30% ethyl acetate in hexanes eluent) to yield 4.7 mg of a mixture of formate acetals, 1.1 mg of 4-MPM-1,2,5,20-tetraol, and 5.2 mg of a mixture of formate *p*-methoxybenzyl ethers.

The mixture of formate acetals was dissolved in methanol (0.1 ml) and 3% aqueous NH_4OH was added. The cloudy mixture was stirred at room temperature for 30 min then rinsed into ethyl acetate over saturated aqueous $NaHCO_3$. The aqueous phase was extracted with ethyl acetate (2 x 10 ml) and the combined extracts were washed with brine, dried over Na_2SO_4, and filtered. Concentration of the filtrate under vacuum yielded a mixture of *p*-methoxybenzylidene acetals. The mixture of acetals was dissolved in toluene (0.4 ml) and the solution was cooled to 0 °C then a solution of diisobutylaluminum hydride (0.02 ml, 2.0M in toluene, 0.08 mmol) was added. The resulting solution was stirred for 3.5 hours then methanol (0.1 ml) was added. The mixture was diluted with ethyl acetate (5 ml) and stirred with saturated aqueous sodium potassium tartrate for 1.5 hours. The aqueous phase was separated and extracted with ethyl acetate (2 x 10 ml) and the combined extracts were washed with brine and dried over Na_2SO_4. Filtration followed by concentration of the filtrate under vacuum yielded 4.5 mg of crude material that was purified by silica gel chromatography (30% ethyl acetate in hexanes eluent) to yield 2.8 mg of 4-MPM-1,2,5,20-tetraol.

The mixture of formate *p*-methoxybenzyl ethers was dissolved in methanol (0.1ml) and 3% aqueous NH_4OH (0.1ml) was added. The cloudy mixture was stirred at room temperature for 30 minutes then rinsed into ethyl acetate over saturated aqueous $NaHCO_3$. The aqueous phase was extracted with ethyl acetate (2 x 10ml) and the combined extracts were washed with brine, dried

over Na_2SO_4, and filtered. Concentration of the filtrate under vacuum yielded 4.8mg of crude material which was purified by silica gel chromatography to yield 3.2mg of 4-MPM-1,2,5,20-tetraol. Total combined yield of 4-MPM-1,2,5,20-tetraol: 68% from 25b.

The resulting solution was stirred at -78 °C for 10 min then warmed to 0 °C for 3 h. The mixture was diluted with 30% ethyl acetate in hexanes (5 mL) then poured into 30% ethyl acetate in hexanes (10 mL) over saturated aqueous $NaHCO_3$. The aqueous phase was extracted with 30% ethyl acetate in hexanes (2 x 5 mL) then the combined extracts were washed with brine, dried with Na_2SO_4, and filtered. Concentration of the filtrate under vacuum yielded 1.3mg of crude material. Purification by silica gel chromatography yielded 0.9 mg of pure 1,2-cyclic carbonate.

To a solution of the carbonate stirred in 0.1 ml of THF and 0.05 mL of methanol was added a solution of pyridinium tosylate (0.005 ml, 0.1M in CH_2Cl_2). The mixture was stirred at room temperature for 24 h and partitioned between saturated sodium bicarbonate and ethyl acetate. The ethyl acetate layer was dried over sodium sulfate and evaporated to give 0.9 mg of diol 27b.

Mesylate 28b. To a stirred solution of diol 27b (0.9 mg) in pyridine (0.6 mL) under nitrogen at 0° C was added dropwise methanesulfonyl chloride (0.02 mL). After 12 h, a saturated aqueous $NaHCO_3$ solution (0.05 mL) was added. The mixture was stirred for 10 min, poured into 20 mL of a saturated aqueous $NaHCO_3$ solution and extracted with 40% ethyl acetate/hexane (20 mL x 3). The combined organic phase was dried over anhydrous Na_2SO_4 and concentrated under reduced pressure to give 1 mg of 28b as a colorless oil.

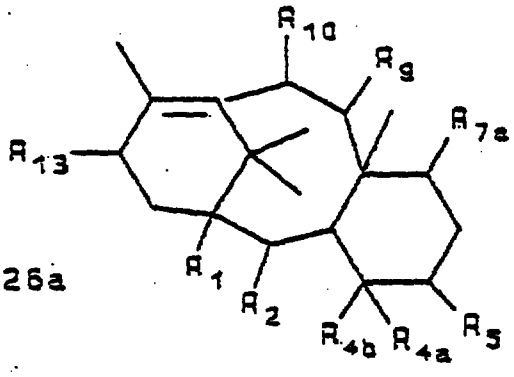

Oxetane 29. To a stirred solution of mesylate 28b (1 mg) in toluene (0.4 mL) under nitrogen at room temperature was added diisopropyl ethylamine (0.008 mL). The solution was refluxed for 3.5 h, cooled to room temperature, poured into 20 mL of a saturated aqueous $NaHCO_3$ solution and extracted with ethyl acetate (20 mL x 3). The combined organic phase was dried over anhydrous Na_2SO_4, and concentrated under reduced pressure to give 1.5 mg of a pale yellow oil. The oil was column chromatographed (30% ethyl acetate/hexane) to yield 1 mg of MPM oxetane. This material was dissolved in 1 mL of methylene chloride, 0.1 mL of 0.1 M phosphate buffer and 1 mg of DDQ were added, and the mixture was stirred at ambient temperature for 2h. The mixture was poured into 20 mL of a saturated aqueous $NaHCO_3$ solution and extracted with ethyl acetate (20 mL x 3). The combined organic phase was dried over anhydrous Na_2SO_4, and concentrated under reduced pressure to give 1.0 mg of an oil. To a stirred solution of this material (1 mg) and dimethyl aminopyridine (1.5 mg) in pyridine (10 μL) under nitrogen at room temperature was added acetic anhydride (5 μL). The solution was stirred for 15 h, diluted with ethyl acetate, poured into 20 mL of a 10% aqueous $CuSO_4$ solution and extracted with ethyl acetate (20 mL x 3). The combined organic phase was washed with a saturated aqueous $NaHCO_3$ solution, dried over anhydrous Na_2SO_4 and concentrated under reduced pressure to give 2 mg of a pale yellow oil. The oil was column chromatographed (25% ethyl acetate/hexane) to yield 0.6 mg of oxetane 29.

In view of the above, it will be seen that the several objects of the invention are achieved.

As various changes could be made in the above compositions without departing from the scope of the invention, it is intended that all matter contained in the above description be interpreted as illustrative and not in a limiting sense.

CLAIMS:

1. An intermediate for use in the preparation of a tricyclic or tetracyclic taxane having the formula:

wherein

R_1 is hydrogen, hydroxy, protected hydroxy or $-OCOR_{38}$, or together with R_2 is a carbonate;

R_2 is hydrogen, hydroxy, protected hydroxy, oxo, or $-OCOR_{31}$, or together with R_1 or R_{4a} is a carbonate;

R_{4a} is hydrogen, alkyl, hydroxy, protected hydroxy, or $-CCOR_{27}$, together with R_{4b} is an oxo, or together with R_2, R_{4b}, or R_5 is a carbonate;

R_{4b} is hydrogen, alkyl, alkenyl, alkynyl, aryl, heteroaryl, or cyano, together with R_{4a} is an oxo, together with R_{4a} or R_5 is a carbonate, or together with R_5 and the carbons to which they are attached form an oxetane ring;

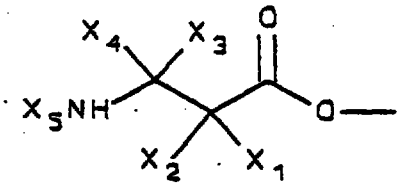

R_5 is hydrogen, hydroxy, protected hydroxy, $-OCOR_{37}$, oxo, together with R_{4a} or R_{4b} is a carbonate, or together with R_{4b} and the carbons to which they are attached form an oxetane ring;

R_{7a} is hydrogen, halogen, hydroxy, protected hydroxy, $-OR_{28}$, or $-OCOR_{34}$, or together with R_9 is a carbonate;

R_9 is hydrogen, oxo, hydroxy, protected hydroxy, $-OR_{28}$, or $-OCOR_{33}$, or together with R_{7a} or R_{10} is a carbonate;

R_{10} is hydrogen, oxo, hydroxy, protected hydroxy, $-OR_{28}$, or $-OCOR_{29}$, or together with R_9 is a carbonate;

R_{11} is hydrogen, hydroxy, protected hydroxy, $-OCOR_{35}$, MO- or

;

R_{28} is a functional group which increases the solubility of the taxane derivative;

R_{27}, R_{29}, R_{30}, R_{31}, R_{33}, R_{34}, R_{35}, and R_{37} are independently hydrogen, alkyl, alkenyl, alkynyl, alkoxy, aryloxy, $-NX_8X_{10}$, $-SX_{10}$, monocyclic aryl or monocyclic heteroaryl;

X_1 is $-OX_6$, $-SX_7$, or $-NX_8X_9$;

X_2 is hydrogen, alkyl, alkenyl, alkynyl, aryl, or heteroaryl;

X_3 and X_4 are independently hydrogen, alkyl, alkenyl, alkynyl, aryl, or heteroaryl;

X_5 is $-COX_{10}$, $-COOX_{10}$, $-COSX_{10}$, $-CONX_8X_{10}$, or $-SO_2X_{11}$;

X_6 is hydrogen, alkyl, alkenyl, alkynyl, aryl, heteroaryl, hydroxy protecting group, or a functional group which increases the water solubility of the taxane derivative;

X_7 is alkyl, alkenyl, alkynyl, aryl, heteroaryl, or sulfhydryl protecting group;

X_8 is hydrogen, alkyl, alkenyl, alkynyl, aryl, or heteroaryl;

X_9 is an amino protecting group;

X_{10} is alkyl, alkenyl, alkynyl, aryl, or heteroaryl;

X_{11} is alkyl, alkanyl, alkynyl, aryl, heteroaryl, $-OX_{10}$, or $-NX_9X_{11}$;

X_{11} is hydrogen, alkyl, alkenyl, alkynyl, aryl, or heteroaryl; and

M comprises ammonium or is a metal.
