

Abstract

Simulation system for combat training of crew members of a military watercraft

5

The invention relates to a simulation system (100) for carrying out simultaneous cooperative combat training of a plurality of crew members (115, 135) of a military watercraft. The simulation system (100) comprises a first simulation environment (110) having a physical control console (112) of the watercraft for training a first group (117) of crew members (115). The first simulation environment (110) comprises one or more first physical control elements (114) of the watercraft for setting one or more control parameters (155) for the operation of the watercraft. The simulation system (100) furthermore comprises a second simulation environment (130), which is spatially separate from the first simulation environment (110), for training a second group (137) of crew members (135). The second simulation environment (130) comprises technical means (132), which are configured to provide a visual simulation, which comprises one or more at least partially virtual copies (134) of one or more second physical control elements of the watercraft for setting the control parameters (155).
