

ABSTRACT OF THE DISCLOSURE

The anisotropic conductive adhesives containing the
conductive, multilayer-structured resin particles in which at
least one inner layer is more flexible than the outermost layer
5 and is chemically bound to at least one of the two adjacent
layers and the surface of the outermost layer is
covered with a metal make connections at lowered pressure enough
to suppress development of cracking of the ITO electrode and
also can provide enhanced stability, especially stability of
10 connection over a prolonged period of time.
