

WAVE POWER GENERATING APPARATUS

【ABSTRACT】

This disclosure relates to a wave power generating apparatus capable
5 of operating a generator with a tidal motion and wave energy of the tide to be
converted into electric energy, and more particularly, to a wave power
generating apparatus capable of generating power by transmitting a rotating
force to a power transmission shaft by means of a tidal motion of the tide when
a float moves upwards and simultaneously capable of generating power by
10 transmitting kinetic energy of the float obtained by lateral force of the tide to the
power transmission shaft.
