(54) Title: SYSTEM FOR AND METHOD OF NETWORK ASSET IDENTIFICATION

(57) Abstract: A method of identifying a new end-user device connected within a network includes monitoring a plurality of remote outlets and detecting a new end-user device upon connection thereof to the network at a first of the remote outlets and determining information about the new end-user device by electronically communicating with some but not all of the remote outlets. A system for performing such a method with a network having a plurality of end-user devices connected thereto is also disclosed.
