

ABSTRACT

SWALLOWING TRAINING APPARATUS

A swallowing training apparatus 100 includes: a respiration detection part 116a configured to detect a respiratory motion of a subject; a swallowing induction part 116c configured to provide a trigger for swallowing induction to the subject on the basis of a detection result from the respiration detection part 116a; a swallowing detection part 116d configured to detect that swallowing was performed by the subject; and a determination output part 116e configured to determine whether or not the swallowing detected by the swallowing detection part 116d was at an appropriate timing with respect to the respiratory motion detected by the respiration detection part 116a, and configured to output information indicating a determination result, to outside.
