

ABSTRACT

Disclosed in the present invention are a data frame transmission method, a data frame transmission device, and a storage medium. The data frame transmission method comprises: determining that transmission of a data frame is switched from a first connection to a second connection; and in response to the transmission of the data frame being switched from the first connection to the second connection, carrying out retransmission counting on the data frame over the second connection. According to the present invention, it is realized that when transmission of a data frame is switched, retransmission of the data frame is counted.
