TAURINE SUPPLEMENTED CELL CULTURE MEDIUM AND METHODS OF USE

FIELD

[0001] The invention relates to medium and methods for the culturing of cells and for the production of recombinant proteins. The invention specifically relates to taurine supplemented medium and methods thereof for the culturing of recombinant eukaryotic cells for the production of protein biotherapeutics.

BACKGROUND

[0002] The organic acid taurine, often called a β-amino acid, is found in high concentrations in most tissues and is a derivative of the amino acid cysteine (Huxtable, RJ., 1992, *Physiol Rev*, 72:101–163).

Structure of Taurine

[0003]

[0004] Taurine is present in many tissues of humans and other mammalian species, *e.g.* brain, retina, myocardium, skeletal and smooth muscle, platelets and neutrophils. Taurine is recognized in helping osmoregulation, membrane stabilization and anti-inflammation, and also regulates mitochondrial protein synthesis through enhanced electron transport chain activity that protects against superoxide generation (Jong et al., 2010, *Journal of Biomedical Science* 17(Suppl 1):S25; Jong et al., 2012, *Amino Acids* 42:2223–2232sw). In primary neuronal cultures, taurine has been characterized as a cytoprotectant, due to its suppression of glutamate-induced toxicity. Various media for embryo culture have been developed containing taurine.

[0005] Cell culture techniques comprising amino acid feeds have a long history of use in the production of recombinant proteins from cultured cells. Amino acids are biosynthetic precursors, energy sources, osmolytes and the like, and their use in production cultures strongly correlates with continuous cell growth and productivity.

[0006] However, the physiological events that contribute to productivity and high yield protein expression are innumerable, and competing metabolic activities and transport mechanisms make the design of feeding strategies a challenge. The type of amino acid supplementation and timing of addition could also have an impact on the quality of the protein produced in culture (Altamirano, et al., 2006, *Electron. J. Biotechnol.* 9:61–67). Accumulation of by-products is often problematic in production cell culture, and is considered a consequence of unbalanced nutrients in cell culture, ultimately inhibiting cell growth (Fan, Y. et al. *Biotechnol Bioeng*. 2015 Mar; 112(3):521-35). Hypotaurine or an analog or

precursor thereof has been suggested in cell culture in order to achieve the desired results of reduced color intensity of a composition comprising a recombinantly produced polypeptide (WO2014145098A1, published 18 September 2014). Cell culture medium including taurine that promotes the maturation of immature retinal pigmented epithelium cells into mature retinal pigmented epithelium cells has also been described (WO2013184809A1, published 12 December 2013). However, optimizing recombinant protein productivity in taurine-supplemented cultures has not been recognized in the art. Cell culture processes that increase the productivity of the recombinantly expressed proteins, while minimizing the output of potentially toxic cell metabolism byproducts, such as ammonia, are highly desirable. Any consistent gain in productivity can equate to significantly higher supply at commercial scale of a biotherapeutic product.

[0007] Thus, there is a need in the art for medium and methods for culturing mammalian cells, wherein the medium allows for healthy and robust cell growth and maintenance, and high-titer production of biopharmaceutical drug substance.

SUMMARY

[0008] The inventors have made the surprising discovery that the inclusion of taurine in a cell culture medium increases cellular specific productivity and allows for lower ammonia byproduct by those cells. Various feeding strategies including taurine permit increased titer protein production. Furthermore, the addition of taurine has no negative impacts on culture performance or resulting antibody quality.

[0009] The present invention provides a method for producing therapeutic protein in high yield comprising culturing a recombinant cell line in medium containing taurine, wherein the cell line comprises a stably integrated nucleic acid encoding the therapeutic protein.

[0010] The present invention relates to a cell culture medium, which is serum-free and comprises about 0.1 mM to about 10 mM taurine. The present invention relates to a cell culture medium, which is serum-free and comprises about 0.1 mM to about 1 mM taurine, about 0.2 to about 1 mM taurine, about 0.3 to about 1 mM taurine, about 0.4 to about 1 mM taurine, or about 0.5 to about 1 mM taurine. The present invention relates to a cell culture medium, which is serum-free and comprises about 1 mM to about 10 mM taurine. The present invention relates to a cell culture medium, which is serum-free and comprises about 1 mM to about 5 mM taurine, about 1 mM to about 6 mM taurine, about 1 mM to about 7 mM taurine, about 1 mM to about 8 mM taurine, or about 1 mM to about 9 mM taurine.

[0011] In some embodiments, the medium further comprises additional amino acids selected from the group consisting of arginine, histidine, lysine, aspartic acid, glutamic acid, serine, threonine, asparagine, glutamine, cysteine, glycine, proline, alanine, valine, isoleucine, leucine, methionine, phenylalanine, tyrosine, and tryptophan.

[0012] In some embodiments, the medium contains ≤ 16 g/L hydrolysate. In some embodiments, the medium is free of any hydrolysate.

[0013] In one embodiment, the medium contains a base medium that is chemically defined, such as a custom formulation or a commercially available base medium. In one embodiment, the complete medium is chemically defined, free of sera and free of hydrolysate.

[0014] In some embodiments, the total process including the base medium and feeds, contains a total of at least 115 mM of a mixture of amino acids or amino acid salts. In one embodiment, the mixture of amino acids comprises amino acids selected from the group consisting of arginine, histidine, lysine, aspartic acid, glutamic acid, serine, threonine, asparagine, glutamine, cysteine, glycine, proline, alanine, valine, isoleucine, leucine, methionine, phenylalanine, tyrosine, and tryptophan, in an amount selected from Table 1.

[0015] In some embodiments, the medium contains one or more fatty acids. In one particular embodiment, the medium contains a mixture of fatty acids (or fatty acid derivatives) and alpha tocopherol. Fatty acids or fatty acid derivatives are selected from the group consisting of linoleic acid, linolenic acid, thioctic acid, oleic acid, palmitic acid, stearic acid, arachidic acid, arachidonic acid, lauric acid, behenic acid, decanoic acid, dodecanoic acid, hexanoic acid, lignoceric acid, myristic acid, and octanoic acid.

[0016] In some embodiments, the medium contains a mixture of nucleosides. In one embodiment, the medium contains adenosine, guanosine, cytidine, uridine, thymidine, and hypoxanthine.

[0017] In some embodiments, the medium contains a mixture of salts. Salts include divalent cations, such as calcium and magnesium. In one embodiment, the medium contains calcium chloride and magnesium sulfate. Other salts may include those of phosphate.

[0018] In one embodiment, the medium (1) contains 0.1 ± 0.015 mM, 1 ± 0.015 mM, 3 ± 0.05 mM, 5 ± 0.10 mM, 7 ± 0.15 mM, or 10 ± 0.2 mM taurine, (2) contains ≤ 16 g/L of a hydrolysate, (3) is serum-free, (4) optionally additionally contains a mixture of amino acids, (5) contains a mixture of fatty acids, (6) contains a mixture of nucleosides including adenosine, guanosine, cytidine, uridine, thymidine, and hypoxanthine, and (7) contains salts of calcium, magnesium, and phosphate.

[0019] The present invention provides a method for producing a protein of interest in high yield comprising culturing a recombinant cell line in a cell culture medium containing at least about 0.1 mM to about 10 mM taurine, wherein the cell line comprises a stably integrated nucleic acid encoding the protein. In other embodiments, the medium embodies any of the foregoing aspects of the invention.

[0020] In another aspect, the invention provides a method for culturing eukaryotic cells for improved recombinant protein production, comprising the steps of: (a) propagating or maintaining cells in a defined cell culture medium during growth phase, (b) supplementing the base cell culture medium with about 0.1 mM to about 10 mM L-taurine and expressing a recombinant protein of interest during production phase, and (c) increasing titer of the protein of interest by the addition of taurine. In some embodiments, the taurine supplement is provided at least once during production phase, or twice, three times, four times, or five times during production phase, or on each day for the duration of the production phase. In other embodiments, the method further comprises supplementing the culture medium with about 0.1 mM to about 10 mM L-taurine during growth phase. In some embodiments, the method provides improved production of recombinant protein compared to a eukaryotic cells lacking taurine supplementation, or with less than 0.1 mM taurine supplementation and under otherwise identical conditions.

[0021] In another aspect, the invention provides a method for cultivating cells in a cell culture medium, such as any embodiment of the medium described in the foregoing aspect. In one embodiment, the method employs the steps of propagating or maintaining a cell or cells in a medium that (1) contains taurine at a concentration of at least 0.1 mM ± 0.015 mM, (2) contains ≤ 16 g/L hydrolysate, or no hydrolysate, (3) is free of sera, (4) and optionally amino acids selected from the group consisting of a mixture of amino acids selected from Table 1.

[0022] In one embodiment, the optional mixture of amino acid supplements are selected from the group consisting of the amino acids in Table 1:

Table 1

Amino acid	RANGE mM (mmol/L)	RANGE (g/L)
Alanine	0-11.2	0-1
Arginine	2.4-11.9	0.5-2.5
Asparagine	1.3-33.3	0.2-5
Aspartic Acid	1.5-93.9	0.2-12.5
Cysteine	1.1-19.9	0.2-3.5
Glutamic acid	1.4-47.6	0.2-7
Glutamine	0-23.9	0-3.5
Glycine	0-16.7	0-1.25
Histidine	1-9.5	0.2-2
Isoleucine	1.5-22.9	0.2-3
Leucine	1.5-38.1	0.2-5
Lysine	2.7-24.6	0.5-4.5

Methionine	1.3-13.4	0.2-2
Phenylalanine	1.2-18.2	0.2-3
Proline	1.7-26.1	0.2-3
Serine	1.9-57.1	0.2-6
Threonine	1.7-33.6	0.2-4
Tryptophan	0.5-14.7	0.1-3
Tyrosine	0.9-22.2	0.2-5
Valine	1.7-34.1	0.2-4

[0023] In some embodiments, the cell or cells are mammalian cells, avian cells, insect cells, yeast cells, or bacteria cells. In one embodiment, the cells are mammalian cells useful in the production of recombinant proteins, such as CHO cells or the derivative CHO-K1. In some embodiments, the cells express a protein of interest, such as a biotherapeutic protein. The biotherapeutic protein may be an antigen binding protein, which may contain an Fc domain. In some embodiments, the protein of interest is an Fc-fusion protein, such as a ScFv molecule or a trap molecule. Trap molecules include, but are not limited to, the VEGF trap and IL-1 Trap proteins. In some embodiments, the protein of interest is an antibody, such as a human monoclonal antibody, humanized monoclonal antibody, a bispecific antibody, or an antibody fragment.

[0024] Given the positive effects on protein production by including taurine in various forms of serum-free media, the cells cultured according to this method result in an average increase in protein titer. In one embodiment, when compared to protein titer in a medium that has not been supplemented with taurine, the cells grown in taurine supplemented culture according to this method produce proteins having a protein titer that is at least 8% greater than the titer of the comparator control culture (*i.e.* culture that has not been supplemented with taurine). In one embodiment, the cells grown in taurine supplemented culture when compared to protein titer in media that has not been supplemented with taurine yield a protein titer that is at least 9%, at least 10%, at least 11%, at least 12%, at least 13%, at least 14%, at least 15%, at least 16%, at least 17%, at least 18%, at least 19%, at least 20%, at least 21%, at least 22%, at least 23%, at least 24%, at least 25%, at least 26%, at least 27%, at least 28%, or at least 29% greater than the titer of the comparator control culture.

[0025] Likewise, the inclusion of taurine alone in serum-free media allows cultured cells to attain lower ammonia byproduct than without the inclusion of taurine. In one serum-free and hydrolysate-free embodiment of the taurine supplemented medium, the cell culture is capable of attaining a reduced ammonia byproduct level (mM NH_3) that is at least 4% lower, up to 32% lower than a similar cell culture in a similar cell culture medium that contains no supplementation (*i.e.* less than 0.1 mM taurine or no taurine supplement).

[0026] In another embodiment, the method includes the step of adding one or more point-of-use additions to the cell culture medium. In some embodiments, the point-of-use addition is any one or more of $NaHCO_3$, glutamine, insulin, glucose, $CuSO_4$, $ZnSO_4$, $FeCl_3$, $NiSO_4$, Na_4EDTA, and Na_3 Citrate. In one embodiment, the method employs the step of adding each of the following point-of-use chemicals to the cell culture medium: $NaHCO_3$, glutamine, insulin, glucose, $CuSO_4$, $ZnSO_4$, $FeCl_3$, $NiSO_4$, Na_4EDTA, and Na_3 Citrate. In some embodiments, the point-of-use additions can be included in the medium at the outset.

[0027] In a specific embodiment, the aspect provides a method for cultivating cells in a serum-free medium consisting essentially of (1) taurine at a concentration of at least 0.1 mM; (2) contains ≤ 16 g/L of a hydrolysate, (3) is serum-free, and (4) optionally additionally contains at least about 20 mM, or at least about 25 mM, or at least about 30 mM, or at least about 40 mM, or at least about 50 mM, or at least about 60 mM, or at least about 70 mM total of a mixture of amino acids selected from the group consisting of alanine, arginine, asparagine, aspartic acid, cysteine, glutamic acid, glutamine, glycine, histidine, isoleucine, leucine, lysine, methionine, phenylalanine, proline, serine, threonine, tryptophan, tyrosine, and valine.

[0028] In another aspect, the invention provides a method for producing a protein of interest by employing the steps of (1) introducing into a cell a nucleic acid sequence that encodes a protein of interest; (2) selecting a cell or cells expressing the protein of interest; (3) culturing the selected cell in an embodiment of the serum-free cell culture medium described in any preceding aspect or according to any embodiment of the method described herein; and (4) expressing the protein of interest in the cell, wherein the protein of interest is secreted into the medium. In some embodiments, the cell used in the production of the protein is a mammalian cell capable of producing a biotherapeutic, such as CHO, 293, and BHK cell, or any derivatives of them. In one embodiment, the cell is a CHO cell, such as a CHO-K1 cell.

[0029] In some embodiments the protein of interest is an antigen binding protein. In some embodiments, the protein of interest is a protein that has an Fc domain. In some cases, those two proteins of interest may overlap, such as in the case of a receptor-Fc-fusion protein, an antibody, and a ScFv protein for example. Thus, in some embodiments, the protein of interest is an antibody, such as a human antibody or a humanized antibody, an antibody fragment, such as an Fab or $F(ab')_2$, a bispecific antibody, a trap molecule, such as a VEGF-Trap or an IL-1-Trap, an ScFv molecule, a soluble TCR-Fc fusion protein, or the like.

[0030] In one embodiment, the protein of interest is capable of being produced at an average 14, 15, 16 or 17 day titer that is at least 8% greater than the average 14, 15, 16 or 17 day titer produced by a similar cell in a serum-free cell culture medium that contains less

than 0.1 mM or no taurine supplementation. In one embodiment, the protein of interest is capable of being produced at an average 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16 or 17 day titer that is at least 9%, at least 10%, at least 11%, at least 12%, at least 13%, at least 14%, at least 15%, at least 16%, at least 17%, at least 18%, at least 19%, at least 20%, at least 21%, at least 22%, at least 23%, at least 24%, at least 25%, at least 26%, at least 27%, at least 28%, or at least 29% greater than the average 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16 or 17 day titer produced by a similar cell in a serum-free cell culture medium that contains less than 0.1 mM or no taurine supplementation.

[0031] In another embodiment, the protein of interest is produced by (1) introducing into a CHO cell a nucleic acid sequence that encodes a protein of interest, such as an antibody or other antigen-binding protein; (2) selecting a cell stably expressing the protein of interest; (3) culturing the selected cell in a serum-free cell culture medium comprising about 0.1 mM to about 10 mM taurine.

BRIEF DESCRIPTION OF THE DRAWINGS

[0032] Fig. 1 shows the protein titer (yield) from samples retrieved at each day of production culture in an Ab3-producing cell culture, where taurine-supplementation is provided (solid squares connected by solid lines) compared to no taurine supplementation (x connected by dotted lines). The benefits of taurine-supplemented culture to protein yield can be seen as early as day 6 of the production culture.

DETAILED DESCRIPTION

[0033] It is to be understood that this invention is not limited to particular methods and experimental conditions described, as such methods and conditions may vary. It is also to be understood that the terminology used herein is for the purpose of describing particular embodiments only, and is not intended to be limiting, since the scope of the present invention is defined by the claims.

[0034] As used in this specification and the appended claims, the singular forms “a”, “an”, and “the” include plural references unless the context clearly dictates otherwise. Thus for example, a reference to “a method” includes one or more methods, and/or steps of the type described herein and/or which will become apparent to those persons skilled in the art upon reading this disclosure.

[0035] Unless defined otherwise, all technical and scientific terms used herein have the same meaning as commonly understood by one of ordinary skill in the art to which this invention belongs. Although any methods and materials similar or equivalent to those described herein can be used in the practice of the present invention, particular methods and

materials are now described. All publications mentioned herein are incorporated herein by reference in their entirety.

[0036] The applicants have made the surprising discovery that the addition of taurine to a cell culture medium improves protein production by a recombinant cell in a cell culture relative to a cell culture medium that contains very little or no taurine.

[0037] Before the present cell cultures and methods are described, it is to be understood that this invention is not limited to particular methods and experimental conditions described, as such methods and conditions may vary. It is also to be understood that the terminology used herein is for the purpose of describing particular embodiments only, and is not intended to be limiting.

[0038] The section headings used herein are for organizational purposes only and are not to be construed as limiting the subject matter described. The methods and techniques described herein are generally performed according to conventional methods known in the art and as described in various general and more specific references that are cited and discussed throughout the present specification unless otherwise indicated. See, e.g., Sambrook et al., Molecular Cloning: A Laboratory Manual, 3rd ed., Cold Spring Harbor Laboratory Press, Cold Spring Harbor, N. Y. (2001) and Ausubel et al., Current Protocols in Molecular Biology, Greene Publishing Associates (1992), Harlow and Lane Antibodies: A Laboratory Manual, Cold Spring Harbor Laboratory Press, Cold Spring Harbor, N.Y. (1990), and Julio E. Celis, Cell Biology: A Laboratory Handbook, 2nd ed., Academic Press, New York, N.Y. (1998), and Dieffenbach and Dveksler, PCR Primer: A Laboratory Manual, Cold Spring Harbor Laboratory Press, Cold Spring Harbor, N.Y. (1995). All publications mentioned throughout this disclosure are incorporated herein by reference in their entirety.

DEFINITIONS

[0039] "Taurine" is also known as 2-aminoethanesulfonic acid (IUPAC nomenclature; CAS Registry No. 107-35-7). "Taurine" and "L-taurine" are used interchangeably to refer to the same organic compound. Taurine is an organic acid containing an amino group, however is not considered an "amino acid" as traditionally known to those in the art, whereas amino acids contain both an amino group and a carboxyl group. Biosynthesis of taurine occurs when hypotaurine, which is a derivative of cysteine, is converted to taurine by oxidation.

[0040] The terms "supplementation", "supplementing", "supplemented with", and the like, refer to adding an ingredient, a component, a molecule, etc. which may be used in a medium for cell culture to maintain and/or promote the growth and/or differentiation of cells, to extend or strengthen an attribute of the culture or cells as a whole, or to make up for a

deficiency. To this end, taurine-supplementation includes the addition of taurine at a particular concentration in a solution to the culture medium.

[0041] The terms "peptide," "polypeptide" and "protein" are used interchangeably throughout and refer to a molecule comprising two or more amino acid residues joined to each other by a peptide bond. Peptides, polypeptides and proteins may also include modifications such as glycosylation, lipid attachment, sulfation, gamma-carboxylation of glutamic acid residues, alkylation, hydroxylation and ADP-ribosylation. Peptides, polypeptides, and proteins can be of scientific or commercial interest, including protein-based drugs. Peptides, polypeptides, and proteins include, among other things, antibodies and chimeric or fusion proteins. Peptides, polypeptides, and proteins are produced by recombinant animal cell lines using cell culture methods.

[0042] The term “heterologous polynucleotide sequence”, as used herein refers to nucleic acid polymers encoding proteins of interest, such as chimeric proteins (like trap molecules), antibodies or antibody portions (e.g., VH, VL, CDR3) that are produced as a biopharmaceutical drug substance. The heterologous polynucleotide sequence may be manufactured by genetic engineering techniques (*e.g.,* such as a sequence encoding a chimeric protein, or a codon-optimized sequence, an intronless sequence, *et cetera*) and introduced into the cell, where it may reside as an episome or be intergrated into the genome of the cell. The heterologous polynucleotide sequence may be a naturally occurring sequence that is introduced into an ectopic site within the production cell genome. The heterologous polypeptide sequence may be a naturally occurring sequence from another organism, such as a sequence encoding a human ortholog.

[0043] “Antibody” refers to an immunoglobulin molecule consisting of four polypeptide chains, two heavy (H) chains and two light (L) chains inter-connected by disulfide bonds. Each heavy chain has a heavy chain variable region (HCVR or VH) and a heavy chain constant region. The heavy chain constant region contains three domains, CH1, CH2 and CH3. Each light chain has a light chain variable region and a light chain constant region. The light chain constant region consists of one domain (CL). The VH and VL regions can be further subdivided into regions of hypervariability, termed complementarity determining regions (CDR), interspersed with regions that are more conserved, termed framework regions (FR). Each VH and VL is composed of three CDRs and four FRs, arranged from amino-terminus to carboxy-terminus in the following order: FR1, CDR1, FR2, CDR2, FR3, CDR3, FR4. The term "antibody" includes reference to both glycosylated and non-glycosylated immunoglobulins of any isotype or subclass. The term "antibody" includes antibody molecules prepared, expressed, created or isolated by recombinant means, such as antibodies isolated from a host cell transfected to express the antibody. The term antibody also includes bispecific antibody, which includes a

heterotetrameric immunoglobulin that can bind to more than one different epitope. Bispecific antibodies are generally described in US Patent Application Publication No. 2010/0331527, which is incorporated by reference into this application.

[0044] The term "antigen-binding portion" of an antibody (or “antibody fragment”), refers to one or more fragments of an antibody that retain the ability to specifically bind to an antigen. Examples of binding fragments encompassed within the term "antigen-binding portion" of an antibody include (i) a Fab fragment, a monovalent fragment consisting of the VL, VH, CL and CH1 domains; (ii) a F(ab')2 fragment, a bivalent fragment comprising two Fab fragments linked by a disulfide bridge at the hinge region; (iii) a Fd fragment consisting of the VH and CH1 domains; (iv) a Fv fragment consisting of the VL and VH domains of a single arm of an antibody, (v) a dAb fragment (Ward et al. (1989) Nature 241:544-546), which consists of a VH domain, (vi) an isolated CDR, and (vii) an scFv, which consists of the two domains of the Fv fragment, VL and VH, joined by a synthetic linker to form a single protein chain in which the VL and VH regions pair to form monovalent molecules. Other forms of single chain antibodies, such as diabodies are also encompassed under the term “antibody” (see e.g., Holliger et al. (1993) PNAS USA 90:6444-6448; Poljak et al. (1994) Structure 2:1121-1123).

[0045] Still further, an antibody or antigen-binding portion thereof may be part of a larger immunoadhesion molecule, formed by covalent or noncovalent association of the antibody or antibody portion with one or more other proteins or peptides. Examples of such immunoadhesion molecules include use of the streptavidin core region to make a tetrameric scFv molecule (Kipriyanov et al. (1995) Human Antibodies and Hybridomas 6:93-101) and use of a cysteine residue, a marker peptide and a C-terminal polyhistidine tag to make bivalent and biotinylated scFv molecules (Kipriyanov et al. (1994) Mol. Immunol. 31:1047-1058). Antibody portions, such as Fab and F(ab')2 fragments, can be prepared from whole antibodies using conventional techniques, such as via papain or pepsin digestion of whole antibodies. Moreover, antibodies, antibody portions and immunoadhesion molecules can be obtained using standard recombinant DNA techniques commonly known in the art (see Sambrook *et al.,* 1989).

[0046] The term "human antibody” is intended to include antibodies having variable and constant regions derived from human germline immunoglobulin sequences. The human antibodies of the invention may include amino acid residues not encoded by human germline immunoglobulin sequences (e.g., mutations introduced by random or site-specific mutagenesis *in vitro* or by somatic mutation *in vivo*), for example in the CDRs and in particular CDR3. However, the term "human antibody", as used herein, is not intended to include antibodies in which CDR sequences derived from the germline of another

mammalian species, such as a mouse, have been grafted onto human framework sequences.

[0047] The term "recombinant human antibody", as used herein, is intended to include all human antibodies that are prepared, expressed, created or isolated by recombinant means, such as antibodies expressed using a recombinant expression vector transfected into a host cell, antibodies isolated from a recombinant, combinatorial human antibody library, antibodies isolated from an animal (e.g., a mouse) that is transgenic for human immunoglobulin genes (see e.g., Taylor et al. (1992) Nucl. Acids Res. 20:6287-6295) or antibodies prepared, expressed, created or isolated by any other means that involves splicing of human immunoglobulin gene sequences to other DNA sequences. Such recombinant human antibodies have variable and constant regions derived from human germline immunoglobulin sequences. In certain embodiments, however, such recombinant human antibodies are subjected to *in vitro* mutagenesis (or, when an animal transgenic for human Ig sequences is used, *in vivo* somatic mutagenesis) and thus the amino acid sequences of the VH and VL regions of the recombinant antibodies are sequences that, while derived from and related to human germline VH and VL sequences, may not naturally exist within the human antibody germline repertoire *in vivo*.

[0048] “Fc fusion proteins” comprise part or all of two or more proteins, one of which is an Fc portion of an immunoglobulin molecule, which are not otherwise found together in nature. Preparation of fusion proteins comprising certain heterologous polypeptides fused to various portions of antibody-derived polypeptides (including the Fc domain) has been described, *e.g.,* by Ashkenazi et al., Proc. Natl. Acad. ScL USA 88: 10535, 1991; Byrn et al., Nature 344:677, 1990; and Hollenbaugh et al., "Construction of Immunoglobulin Fusion Proteins", in Current Protocols in Immunology, Suppl. 4, pages 10.19.1 - 10.19.11, 1992. “Receptor Fc fusion proteins” comprise one or more extracellular domain(s) of a receptor coupled to an Fc moiety, which in some embodiments comprises a hinge region followed by a CH2 and CH3 domain of an immunoglobulin. In some embodiments, the Fc-fusion protein contains two or more distinct receptor chains that bind to a one or more ligand(s). For example, an Fc-fusion protein is a trap, such as for example an IL-1 trap (*e.g.,* rilonacept, which contains the IL-1RAcP ligand binding region fused to the IL-1R1 extracellular region fused to Fc of hIgG1; see U.S. Pat. No. 6,927,004), or a VEGF trap (*e.g.,* aflibercept, which contains the Ig domain 2 of the VEGF receptor Flt1 fused to the Ig domain 3 of the VEGF receptor Flk1 fused to Fc of hIgG1; see U.S. Pat. Nos. 7,087,411 and 7,279,159).

CELL CULTURE

[0049] The terms "cell culture medium" and "culture medium" refer to a nutrient solution used for growing mammalian cells that typically provides the necessary nutrients to

enhance growth of the cells, such as a carbohydrate energy source, essential (e.g. phenylalanine, valine, threonine, tryptophan, methionine, leucine, isoleucine, lysine, and histidine) and nonessential (e.g. alanine, asparagine, aspartic acid, cysteine, glutamic acid, glutamine, glycine, proline, serine, and tyrosine) amino acids, trace elements, energy sources, lipids, vitamins, etc. Cell culture medium may contain extracts, e.g. serum or peptones (hydrolysates), which supply raw materials that support cell growth. Media may contain yeast-derived or soy extracts, instead of animal-derived extracts. Chemically defined medium refers to a cell culture medium in which all of the chemical components are known (i.e. have a known chemical structure). Chemically defined medium is entirely free of animal-derived components, such as serum- or animal-derived peptones. In one embodiment, the medium is a chemically defined medium.

[0050] The solution may also contain components that enhance growth and/or survival above the minimal rate, including hormones and growth factors. The solution is preferably formulated to a pH and salt concentration optimal for cell survival and proliferation.

[0051] A “cell line” refers to a cell or cells that are derived from a particular lineage through serial passaging or subculturing of cells. The term “cells” is used interchangeably with “cell population”.

[0052] The term “cell” includes any cell that is suitable for expressing a recombinant nucleic acid sequence. Cells include those of eukaryotes, such as non-human animal cells, mammalian cells, human cells, avian cells, insect cells, yeast cells, or cell fusions such as, for example, hybridomas or quadromas. In certain embodiments, the cell is a human, monkey, ape, hamster, rat or mouse cell. In other embodiments, the cell is selected from the following cells: CHO (*e.g.* CHO K1, DXB-11 CHO, Veggie-CHO), COS (e.g. COS-7), retinal cell, Vero, CV1, kidney (*e.g.* HEK293, 293 EBNA, MSR 293, MDCK, HaK, BHK21), HeLa, HepG2, WI38, MRC 5, Colo25, HB 8065, HL-60, lymphocyte, *e.g.* Jurkat (T lymphocyte) or Daudi (B lymphocyte), A431 (epidermal), CV-1, U937, 3T3, L cell, C127 cell, SP2/0, NS-0, MMT cell, stem cell, tumor cell, and a cell line derived from an aforementioned cell. In some embodiments, the cell comprises one or more viral genes, *e.g.* a retinal cell that expresses a viral gene (*e.g.* a PER.C6® cell). In some embodiments, the cell is a CHO cell. In other embodiments, the cell is a CHO K1 cell.

[0053] One aspect of the invention relates to a seed culture in which a cell population is expanded prior to protein production and harvest in the production culture. Taurine may be added to the base medium in a seed culture formulation, according with the invention as decribed herein.

[0054] Another aspect of the invention relates to a production culture in which protein is produced and harvested. Prior to production phase, there is typically a growth phase (also

known as a seed train or seed culture) wherein all components for cell culturing are supplied to the culturing vessel at the start of the culturing process then cell population is expanded until ready for production scale. As such, the culturing vessel is inoculated with cells at a suitable seeding density for the initial cell growth phase depending on the starting cell line. In some aspects, taurine may be added to the basal culture medium in a seed culture formulation, according with the invention as described herein in order to further improve or enhance the productivity of the cells in the subsequent production phase.

[0055] One aspect of the invention relates to a production culture wherein cell culture conditions are modified to enhance the growth of recombinant eukaryotic cells while improving the production of one or more recombinant proteins of interest by such cells and maintaining cell viability, in particular by adding taurine to the production culture medium and/or the seed train culture. In the production culturing vessel or bioreactor, a basal culture medium and cells are supplied to a culturing vessel following a seed culture or growth phase. In certain embodiments, the cell supernatant or cell lysate is harvested following the production culture. In other embodiments, the polypeptide or protein of interest is recovered from the culture medium or cell lysate, or whatever the case may be depending on the location of the protein of interest, using techniques well known in the art

[0056] Culturing vessels include, but are not limited to well plates, T-flasks, shake flasks, stirred vessels, spinner flasks, hollow fiber, air lift bioreactors, and the like. A suitable cell culturing vessel is a bioreactor. A bioreactor refers to any culturing vessel that is manufactured or engineered to manipulate or control environmental conditions. Such culturing vessels are well known in the art.

[0057] Bioreactor processes and systems have been developed to optimize gas exchange, to supply sufficient oxygen to sustain cell growth and productivity, and to remove CO_2. Maintaining the efficiency of gas exchange is an important criterion for ensuring successful scale up of cell culture and protein production. Such systems are well-known to the person having skill in the art.

[0058] In the polypeptide production phase, a "fed-batch cell culture" or “fed-batch culture” refers to a batch culture wherein the animal cells and culture medium are supplied to the culturing vessel initially and additional culture nutrients are slowly fed, continuously or in discrete increments, to the culture during culturing, with or without periodic cell and/or product harvest before termination of culture. Fed-batch culture includes "semi-continuous fed-batch culture" wherein periodically whole culture (which may include cells and medium) is removed and replaced by fresh medium. Fed-batch culture is distinguished from simple "batch culture" whereas all components for cell culturing (including the animal cells and all culture nutrients) are supplied to the culturing vessel at the start of the culturing process in batch culture. Fed-batch culture can be further distinguished from perfusion culturing insofar

as the supernatant is not removed from the culturing vessel during the process, whereas in perfusion culturing, the cells are restrained in the culture by, e.g., filtration, and the culture medium is continuously or intermittently introduced and removed from the culturing vessel. However, removal of samples for testing purposes during fed-batch cell culture is contemplated. The fed-batch process continues until it is determined that maximum working volume and/or protein production is reached.

[0059] The phrase "continuous cell culture" when used herein relates to a technique used to grow cells continually, usually in a particular growth phase. For example, if a constant supply of cells is required, or the production of a particular polypeptide or protein of interest is required, the cell culture may require maintenance in a particular phase of growth. Thus, the conditions must be continually monitored and adjusted accordingly in order to maintain the cells in that particular phase.

MEDIA

The present invention provides a cell culture medium, which is serum-free, comprising about 0.1 mM to 10 mM taurine. "Serum-free" applies to a cell culture medium that does not contain animal sera, such as fetal bovine serum. The serum-free media may contain ≤ 16 g/L of hydrolysates, such as soy hydrolysate. The present invention also provides chemically defined media, which is not only serum-free, but also hydrolysate-free. "Hydrolysate-free" applies to cell culture media that contains no exogenous protein hydrolysates such as animal or plant protein hydrolysates such, for example peptones, tryptones and the like. "Base medium" is the initial medium (present in the seed train and/or at day 0 of the cell culture production) in which the cells are propagated and contains all the necessary nutrients, which includes a base mixture of amino acids. Various recipes (*i.e.* formulations) for base media may be manufactured or purchased in commercially available lots. Likewise "base feed medium" contains mixtures of supplemental nutrients that are commonly consumed during a production culture and are utilized in a feeding strategy (for a so-called "fed-batch" culture). Varieties of base feed media are commercially available. A "feed" includes scheduled additions or additions to media at regular intervals, such as according to a protocol, including a continuous feed culture system, as in a chemostat (see C. Altamirano *et al.,* Biotechnol Prog. 2001 Nov-Dec; 17(6):1032-41), or according to a fed-batch process (Y.M. Huang *et al.,* Biotechnol Prog. 2010 Sep-Oct;26(5): 1400-10). For example, a culture may be fed once per day, every other day, every three days, or may be fed when the concentration of a specific medium component, which is being monitored, falls outside a desired range.

[0060] The elimination of serum and reducing or eliminating hydrolysates from cell culture media, while reducing lot-to-lot variability and enhancing downstream processing steps, unfortunately diminishes cell growth, viability and protein expression. Thus, chemically

defined serum-free and low to no hydrolysate media requires additional ingredients to improve cell growth and protein production.

[0061] Thus, the cell culture medium of the invention comprises a base medium containing all necessary nutrients for a viable cell culture. Taurine may be added to the base medium in a seed culture formulation, according with the invention as decribed herein. Furthermore, taurine may be added to the base medium in a production culture formulation, which may then be fed periodically (as in so-called "fed-batch" cultures) with or without additional ingredients such as polyamines or increased concentrations of components like amino acids, salts, sugars, vitamins, hormones, growth factors, buffers, antibiotics, lipids, trace elements and the like, depending on the requirements of the cells to be cultured or the desired cell culture parameters.

[0062] The invention provides that the taurine-supplemented cell culture medium may be depleted of amino acids over the course of the protein production culture, where no additional amino acid supplementation is provided, or the taurine-supplemented cell culture medium may be "non-depleted", where amino acid supplementation is provided for the depleted amino acids (as described below). The inventors have observed that cultures supplemented during production phase with taurine improve recombinant protein production under various culture conditions as described in the foregoing.

[0063] The invention provides taurine-supplemented medium which contains taurine at a concentration (expressed in millimoles per liter) of at least about 0.1, 0.2, 0.3, 0.4, 0.5, 0.6, 0.7, 0.8, 0.9, 1, 2, 3, 4, 5, 6, 7, 8, 9 or 10 mM.

[0064] In one embodiment, the medium additionally contains 100 µM ± 15 µM ornithine, or 300 µM ± 45 µM ornithine, or 600 µM ± 90 µM ornithine, or even 900 µM ± 135 µM ornithine. In another embodiment, the medium contains at least about 5 mg/L± 1 mg/L ornithine • HCl, or at least about ,10 mg/L ± 2 mg/L ornithine • HCl, 15 mg/L ± 2.25 mg/L ornithine • HCl, or at least about 50 mg/L ± 7.5 mg/L ornithine • HCl, or at least about 100 mg/L ± 15 mg/L ornithine • HCl, or at least about 150 mg/L ± 22.5 mg/L ornithine • HCl.

[0065] Putrescine may optionally be added to the supplemented media. Putrescine has been included, at very low concentrations, as a component in some cell culture media formulations; see for example WO 2005/028626, which describes 0.02-0.08 mg/L putrescine; US Patent No. 5,426,699 (0.08 mg/L); US Patent No. RE30,985 (0.16 mg/L); US Patent No. 5,811,299 (0.27 mg/L); US Patent No. 5,122,469 (0.5635 mg/L); US Patent No. 5,063,157 (1 mg/L); WO 2008/154014 (~100 µM - ~ 1000 µM); US Pat. App. No. 2007/0212770 (0.5 – 30 mg/L polyamine; 2 mg/L putrescine; 2 mg/L putrescine + 2 mg/L ornithine; 2 mg/L putrescine + 10 mg/L ornithine).

[0066] In some embodiments, the media is further supplemented with a combination of ornithine and putrescine, wherein the putrescine can be at a concentration of at least

about 150 to 720 μM. In some embodiments, the media is further supplemented with putrescine at a concentration of about 170 to 230 μM. In one embodiment, the medium contains 200 μM ± 30 μM putrescine in addition to ≥ 90 μM ± 15 μM ornithine. In one embodiment, the medium contains ≤ 30 mg/L ± 4.5 mg/L putrescine • 2HCl in addition to ≤ 15 mg/L ± 2.25 mg/L ornithine. In another embodiment, the medium contains ≥ 30 mg/L ± 4.5 mg/L putrescine • 2HCl in addition to ≥ 15 mg/L ± 2.25 mg/L ornithine • HCl. (See International Publication No. WO2014/144198A1, published on September 18, 2014, which is herein incorporated by reference in its entirety.)

[0067] In still other embodiments, ornithine is present in the medium at a concentration ranging from 0.09 ± 0.014 mM to 0.9 ± 0.14 mM, such as 0.09 ± 0.014 mM, 0.3 ± 0.05 mM, 0.6 ± 0.09 mM, or 0.9 ± 0.14 mM ornithine. In some embodiments, the medium also contains at least 0.20 ± 0.03 mM putrescine. In some embodiments, the additional putrescine is at a concentration ranging from 0.20 ± 0.03 mM to 0.714 ± 0.11 mM, such as 0.20 ± 0.03 mM, 0.35 ± 0.06, or 0.714 ± 0.11 mM putrescine.

[0068] Various other supplements may be added to the culture medium, and are within the skill of the person in the art to determine additionally appropriate conditions. In some embodiments, the medium is supplemented with a mixture of amino acids selected from the group consisting of aspartic acid, cysteine, glutamic acid, glycine, lysine, phenylalanine, proline, serine, threonine, valine, arginine, histidine, asparagine, glutamine, alanine, isoleucine, leucine, methionine, tyrosine, and tryptophan, in order to be non-depleted or as supplemental nutrients are needed.

[0069] In one embodiment, the media is further supplemented with about 170 μM to 175 μM nucleosides. In one embodiment, the media contains purine derivatives in a cumulative concentration of at least 40 μM, at least 45 μM, at least 50 μM, at least 55 μM, at least 60 μM, at least 65 μM, at least 70 μM, at least 75 μM, at least 80 μM, at least 85 μM, at least 90 μM, at least 95 μM, at least 100 μM, or at least 105 μM. In one embodiment, the media contains about 100 μM to 110 μM of purine derivatives. Purine derivatives include hypoxanthine and the nucleosides adenosine and guanosine. In one embodiment, the media contains pyrimidine derivatives in a cumulative concentration of at least 30 μM, at least 35 μM, at least 40 μM, at least 45 μM, at least 50 μM, at least 55 μM, at least 60 μM, or at least 65 μM. In one embodiment, the media contains about 65 μM to 75 μM of pyrimidine derivatives. Pyrimidine derivatives include the nucleosides thymidine, uridine, and cytidine. In one particular embodiment, the media contains adenosine, guanosine, cytidine, uridine, thymidine and hypoxanthine.

[0070] In addition to the inclusion of any of the above additives, in one embodiment, the media is further supplemented with micromolar amounts of fatty acids (or fatty acid derviatives) and tocopherol. In one embodiment, the fatty acids include any one or more of

linoleic acid, linolenic acid, thioctic acid, oleic acid, palmitic acid, stearic acid, arachidic acid, arachidonic acid, lauric acid, behenic acid, decanoic acid, dodecanoic acid, hexanoic acid, lignoceric acid, myristic acid, and octanoic acid. In one embodiment, the media contains tocopherol, linoleic acid, and thioctic acid.

[0071] In one embodiment, the media also may be further supplemented with a mixture of vitamins, which includes other nutrients and essential nutrients, at a cumulative concentration of at least about 700 µM or at least about 2 mM. In one embodiment, the mixture of vitamins contains one or more of D-biotin, choline chloride, folic acid, myo-inositol, niacinamide, pyridoxine HCl, D-pantothenic acid (hemiCa), riboflavin, thiamine HCl, vitamin B12, and the like. In one embodiment, the mixture of vitamins includes all of D-biotin, choline chloride, folic acid, myo-inositol, niacinamide, pyridoxine HCl, D-pantothenic acid (hemiCa), riboflavin, thiamine HCl, and vitamin B12.

[0072] Various embodiments of the media of the invention include any of the combinations of the above described embodiments, including chemically defined, hydrolysate-free serum-free media comprising taurine in the indicated amounts, plus *inter alia* (a) amino acids; (b) optionally nucleosides; (c) salts of divalent cations; (d) fatty acids and tocopherol; and (e) vitamins. In some embodiments, all small amounts of hydrolysates may be added to the taurine-supplemented media.

[0073] The applicants envision that in the practice of this invention any one or more of a variety of base media or combinations thereof, to which the taurine may be used. Base media are generally known in the art and include *inter alia* Eagle's MEME (minimal essential media) (Eagle, Science, 1955, 112(3168):501-504), Ham's F12 (Ham, Proc. Nat'l. Acad. Sci. USA, 1965, 53:288-293), F-12 K medium, Dulbecco's medium, Dulbecco's Modified Eagle Medium (Proc. Natl. Acad. Sci. USA., 1952 August; 38(8): 747–752), DMEM/ Ham's F12 1:1, Trowell's T8, A2 media Holmes and Wolf, Biophys. Biochem. Cytol., 1961, 10:389-401), Waymouth media (Davidson and Waymouth, Biochem. J., 1945, 39(2):188–199), Williams E media (William's et al., Exp. Cell Res., 1971, 69:105 *et seq.*), RPMI 1640 (Moore et al., J. Amer. Med. Assoc., 1967, 199:519-524), MCDB 104/110 media (Bettger et al., Proc. Nat'l. Acad. Sci. USA, 1981, 78(9):5588-5592), Ventrex HL-1 media, albumin-globulin media (Orr et al., Appl. Microbiol., 1973, 25(1):49-54), RPMI- 1640 Medium, RPMI- 1641 Medium, Iscove's Modified Dulbecco's Medium, McCoy's 5 A Medium, Leibovitz's L- 15 Medium, and serum-free media such as EX-CELL™ 300 Series (JRH Biosciences, Lenexa, Kansas), protamine-zinc-insulin media (Weiss et al., 1974, US 4,072,565), biotin-folate media (Cartaya, 1978, US Re30,985), Transferrin-fatty acid media (Baker, 1982, US 4,560,655), transferrin-EGF media (Hasegawa, 1982, US 4,615,977; Chessebeuf, 1984, US 4,786,599), and other media permutations (see Inlow, US 6,048,728; Drapeau, US 7,294,484; Mather, US 5,122,469; Furukawa, US 5,976,833; Chen, US 6,180,401; Chen, US 5,856,179;

Etcheverry, US 5,705,364; Etcheverry, US 7,666,416; Ryll, US 6,528,286; Singh, US 6,924,124; Luan, US 7,429,491; and the like).

[0074] In a particular embodiment, the media is chemically defined and contains in addition to the taurine: amino acid mixtures as defined herein, $CaCl_2$ $2H_2O$; HEPES buffer, KCl; $MgSO_4$; NaCl; Na_2HPO_4 or other phosphate salts; pyruvate; D-biotin; choline chloride; folic acid; myo-inositol; niacinamide; pyridoxine HCl; D-pantothenic acid; riboflavin; thiamine HCl; vitamin B12; ρ-aminobenzoic acid; ethanolamine HCl; poloxamer 188; DL-a-tocopherol phosphate; linoleic acid; Na_2SeO_3; thioctic acid; and glucose; and optionally adenosine; guanosine; cytidine; uridine; thymidine; and hypoxanthine 2Na.

[0075] In one embodiment, the starting osmolarity of the media of the invention is 200-500, 250-400, 275-350, or about 300 mOsm. During growth of the cells in the media of the invention, and in particular following any feedings according to a fed batch protocol, the osmolarity of the culture may increase up to about 350, 400, 450, 500 or up to about 550 mOsm.

[0076] In some embodiments wherein the osmolarity of the defined medium is less than about 300, the osmolarity is brought to about 300 with the addition of one or more salts in excess of the amount specified. In one embodiment, osmolarity is increased to a desired level by adding one or more of an osmolyte selected from sodium chloride, potassium chloride, a magnesium salt, a calcium salt, an amino acid salt, a salt of a fatty acid, sodium bicarbonate, sodium carbonate, potassium carbonate, a chelator that is a salt, a sugar (*e.g.,* galactose, glucose, sucrose, fructose, fucose, *etc.*), and a combination thereof. In one embodiment, the osmolyte is added over and above its concentration in a component already present in the defined medium (*e.g.*, a sugar is added over and above the concentration specified for a sugar component).

[0077] Each and every embodiment of the media described above, as well as any other serum-free media containing at least about 0.1 mM taurine is referred to as taurine supplemented media. Conversely, media containing no taurine, or media containing less than 0.1 mM taurine, are hereinafter referred to as non-taurine supplemented media or no taurine supplementation.

FED-BATCH CULTURE

[0078] Feeding strategies for cell culture aim to ensure the optimal growth and propagation of cells outside of a multicellular organism or tissue. Suitable culture conditions for mammalian cells are known in the art. See e.g. Animal cell culture: A Practical Approach, D. Rickwood, ed., Oxford University Press, New York (1992). Mammalian cells may be cultured in suspension or while attached to a solid substrate. Fluidized bed bioreactors, hollow fiber bioreactors, roller bottles, shake flasks, or stirred tank bioreactors, with or

without microcarriers, and operated in a batch, fed batch, continuous, semi-continuous, or perfusion mode are available for mammalian cell culture. Cell culture media or concentrated feed media may be added to the culture continuously or at intervals during the culture. For example, a culture may be fed once per day, every other day, every three days, or may be fed when the concentration of a specific medium component, which is being monitored, falls outside a desired range.

[0079] In addition to the inclusion of taurine, in one embodiment, media may be further supplemented with amino acids in a cumulative (total) concentration of at least 20 mM. In one embodiment, the concentration of initial amino acids included in the starting cell culture medium is not included in such cumulative (total) concentration of supplemented amino acids. In one embodiment of the cell culture medium, or in the method to culture cells or the method to produce a protein of interest, the media may be supplemented in an amount greater than about 20 mM, greater than about 25 mM, greater than about 30 mM, greater than about 40 mM greater than about 50 mM, or greater than about 60 mM, greater than about 70 mM, greater than about 100 mM, greater than about 200 mM, greater than about 300 mM, greater than about 400 mM, or greater than about 500 mM See also Table 1 herein. In one embodiment the amount of amino acids added to the media is about 30 mM ± 10 mM or more.

[0080] Supplemental feeding regimens may be optimized by those skilled in the art to support cell growth, minimize cell stress, or to provide a "non-depleted medium" during production phase.

[0081] "Non-depleted medium" includes cell culture medium that has been determined to have the nutrients, in particular, the amino acids necessary for production of a recombinant protein of interest. Amino acid feeds typically supplement the amino acids needed as building blocks for producing a recombinant protein in a cell culture. However, some amino acids may be depleted faster than others depending on the requirements of that particular protein produced by the cells in culture. In a non-depleted medium, the feeding regime has been determined such that necessary amino acids are replenished as they are consumed. Thus, depletion and subsequently optimal consumption rates (pg/cell-day) may be determined by the following steps: culturing eukaryotic cell(s) expressing the protein of interest in a cell culture medium; measuring each amino acid concentration in the culture medium at time points to establish a depletion level; identifying the depletion time point at which the amino acid concentration falls below the depletion level; calculating consumption rates for each amino acid; and determining the optimal consumption rate as the consumption rate at the time point immediately prior to the depletion time point. The cell culture is then supplemented with an appropriate concentration of a particular amino acid to maintain such

optimal consumption rates as determined, in order for the culture medium to be non-depleted.

[0082] It is understood that the present invention provides a taurine-supplemented cell culture medium that improves protein titer in depleted, as well as non-depleted, cultures.

[0083] The present invention provides a cell culture comprising a cell line expressing a protein of interest in a taurine-supplemented medium as described above. Examples of cell lines that are routinely used to produce protein biotherapeutics include *inter alia* primary cells, BSC cells, HeLa cells, HepG2 cells, LLC-MK cells, CV-1 cells, COS cells, VERO cells, MDBK cells, MDCK cells, CRFK cells, RAF cells, RK cells, TCMK-1 cells, LLCPK cells, PK15 cells, LLC-RK cells, MDOK cells, BHK cells, BHK-21 cells, CHO cells, CHO-K1 cells, NS-1 cells, MRC-5 cells, WI-38 cells, 3T3 cells, 293 cells, Per.C6 cells and chicken embryo cells. In one embodiment, the cell line is a CHO cell line or one or more of several specific CHO cell variants optimized for large-scale protein production, *e.g.,* CHO-K1.

[0084] In one embodiment, the taurine-supplemented cell culture contains insulin, which can be added as a point-of-use ingredient to the media, or can be included in the media formulation. In one embodiment, the cell line comprises cells capable of producing a biotherapeutic protein.

[0085] In one embodiment, the media is supplemented at intervals during cell culture according to a fed-batch process. Fed-batch culturing is generally known in the art and employed to optimize protein production (see Y.M. Huang *et al.,* Biotechnol Prog. 2010 Sep-Oct;26(5): 1400-10).

[0086] The cell growth phase or seed culture (*i.e.* a first cell culture) where no exchange of medium is provided, is typically followed by a distinct second culture, known as the polypeptide production phase. Fed-batch processes are typically used during the production phase.

[0087] The invention provides a cell culture medium comprising about 0.1 mM to about 10 mM taurine at the start of production cell culture (day 0). Alternatively, cell culture medium comprising about 0.1 mM to about 10 mM taurine may be supplemented on day 1, day 2, day 3, day 4, day 5, day 6, day 7, day 8, day 9, and/or day 10 of the production cell culture. The cell culture medium added to the production culture on multiple days comprises a total amount of taurine between about 0.1 mM to about 10 mM. The cell culture medium comprising total taurine between about 0.1 mM to about 10 mM may be added in any sequential manner.

[0088] Taurine may also be supplemented in the basal medium in the seed train expansion phase.

[0089] Supplemental feed may be performed to include additional nutrients, such as vitamins, amino acids and other nutrients as described hereinabove, at intervals at a

frequency of every day, or every 2-3 days, for the duration of the production culture. Supplemented feed may be performed (supplemented media containing nutrients are added) at least 2 times, or at least 8 times, throughout the duration of the production culture for a 2 week or more culture. In another embodiment, the supplemental feed could be performed on each day for the duration of the culture. Alternative culture feeding schedules are also envisioned.

[0090] Additional amino acid supplementation may also be performed to provide a non-depleted medium, wherein depleted amino acids are determined according to methods known in the art and described herein. When this regime is employed, additional amino acids are supplemented or added at intervals, preferably at a frequency of every day, or every 2-3 days, for the duration of the production culture, depending on the determination of amino acid depletion. In one embodiment, the mixture of additional amino acids to maintain a non-depleted cell culture medium is added to the culture on or about day 1, on or about day 2, on or about day 3, on or about day 4, on or about day 5, on or about day 6, on or about day 7, on or about day 8, on or about day 9, on or about day 10, on or about day 11, on or about day 12, on or about day 13, and on or about day 14, for a 2 week or more culture. Alternative culture feeding schedules are also envisioned.

[0091] Animal cells, such as CHO cells, may be cultured in small scale cultures, such as in 125 ml containers having about 25 mL of media, 250 mL containers having about 50 to 100 mL of media, 500 mL containers having about 100 to 200 mL of media. Alternatively, the cultures can be large scale such as for example 1000 mL containers having about 300 to 1000 mL of media, 3000 mL containers having about 500 mL to 3000 mL of media, 8000 mL containers having about 2000 mL to 8000 mL of media, and 15000 mL containers having about 4000 mL to 15000 mL of media. Cultures for manufacturing can contain 10,000 L of media or more. Large scale cell cultures, such as for clinical manufacturing of protein therapeutics, are typically maintained for days, or even weeks, while the cells produce the desired protein(s). During this time the culture can be supplemented with a concentrated feed medium containing components, such as nutrients and amino acids, which are consumed during the course of the culture. Concentrated feed medium may be based on any cell culture media formulation. Such a concentrated feed medium can contain most of the components of the cell culture medium at, for example, about 5X, 6X, 7X, 8X, 9X, 10X, 12X, 14X, 16X, 20X, 30X, 50X, 100X, 200X, 400X, 600X, 800X, or even about 1000X of their normal useful amount. Concentrated feed media are often used in fed batch culture processes.

[0092] In some embodiments, the cell culture containing taurine is further supplemented with “point-of-use additions”, also known as additions, point-of-use ingredients, or point-of-use chemicals, during the course of cell growth or protein production.

Point-of-use additions include any one or more of a growth factor or other proteins, a buffer, an energy source, a salt, an amino acid, a metal, and a chelator. Other proteins include transferrin and albumin. Growth factors, which include cytokines and chemokines, are generally known in the art and are known to stimulate cell growth, or in some cases, cellular differentiation. A growth factor is usually a protein (*e.g.,* insulin), a small peptide, or a steroid hormone, such as estrogen, DHEA, testosterone, and the like. In some cases, a growth factor may be a non-natural chemical that promotes cell proliferation or protein production, such as *e.g.*, tetrahydrofolate (THF), methotrexate, and the like. Non-limiting examples of protein and peptide growth factors include angiopoietins, bone morphogenetic proteins (BMPs), brain-derived neurotrophic factor (BDNF), epidermal growth factor (EGF), erythropoietin (EPO), fibroblast growth factor (FGF), glial cell line-derived neurotrophic factor (GDNF), granulocyte colony-stimulating factor (G-CSF), granulocyte macrophage colony-stimulating factor (GM-CSF), growth differentiation factor-9 (GDF9), hepatocyte growth factor (HGF), hepatoma-derived growth factor (HDGF), insulin, insulin-like growth factor (IGF), migration-stimulating factor, myostatin (GDF-8), nerve growth factor (NGF) and other neurotrophins, platelet-derived growth factor (PDGF), thrombopoietin (TPO), transforming growth factor alpha (TGF-α), transforming growth factor beta (TGF-β), tumor necrosis factor-alpha (TNF-α), vascular endothelial growth factor (VEGF), wnt signaling pathway agonists, placental growth factor (PlGF), fetal Bovine somatotrophin (FBS), interleukin-1 (IL-1), IL-2, IL-3, IL-4, IL-5, IL-6, IL-7, and the like. In one embodiment, the cell culture media is supplemented with the point-of-use addition growth factor insulin. In one embodiment, the concentration of insulin in the media, *i.e.,* the amount of insulin in the cell culture media after addition, is from about 0.1 μM to 10 μM.

[0093] Buffers are generally known in the art. The invention is not restricted to any particular buffer or buffers, and any one of ordinary skill in the art can select an appropriate buffer or buffer system for use with a particular cell line producing a particular protein. In one embodiment, a point-of-use addition buffer is $NaHCO_3$. In another embodiment, the buffer is HEPES. In other embodiments, the point-of-use addition buffer comprises both $NaHCO_3$ and HEPES.

[0094] Energy sources for use as a point-of-use addition in cell culture are also well known in the art. Without limitation, in one embodiment, the point-of-use addition energy source is glucose. Given the particular and specific requirements of a particular cell line and the protein to be produced, in one embodiment the glucose can be added to a concentration of about 1 to 20 mM in the media. In some cases, glucose can be added at high levels of 20 g/L or higher.

[0095] Chelators are likewise well known in the art of cell culture and protein production. Tetrasodium EDTA dehydrate and citrate are two common chelators used in the

art, although other chelators may be employed in the practice of this invention. In one embodiment, a point-of-use addition chelator is tetrasodium EDTA dihydrate. In one embodiment, a point-of-use addition chelator is citrate, such as $Na_3C_6H_5O_7$.

[0096] In one embodiment, the cell culture medium may additionally be supplemented with one or more point-of-use addition amino acids as an energy source, such as *e.g.,* glutamine. In one embodiment, the cell culture media is supplemented with the point-of-use addition glutamine at a final concentration of about 1 mM to 13 mM.

[0097] Other point-of-use additions include one or more of various metal salts, such as salts of iron, nickel, zinc and copper. In one embodiment, the cell culture media is supplemented with any one or more of copper sulfate, zinc sulfate, ferric chloride, and nickel sulfate.

[0098] In some embodiments, the protein titer yielded from cell culture in taurine supplemented media is at least 4%, at least 5%, at least 6%, at least 7%, at least 8%, at least 9%, at least 10%, at least 11%, at least 12%, at least 13%, at least 14%, at least 15%, at least 16%, at least 17%, at least 18%, at least 19%, at least 20%, at least 21%, at least 22% greater, at least 23% greater, at least 24% greater, at least 25% greater, at least 26% greater, at least 27% greater, at least 28% greater or at least 29% greater than the protein titer (yield) from cells cultured in non-taurine supplemented. In some embodiments, the protein titer yielded from cells in taurine supplemented media is at least 2%, at least 3%, at least 4%, or at least 5% greater than the protein titer (yield) from similar or identical cells cultured in non-taurine supplemented media.

[0099] In some embodiments, the ammonia accumulation in cell culture is decreased greater than 4%, greater than 5%, greater than 6%, greater than 7%, greater than 8%, greater than 9%, greater than 10%, greater than 15%, or greater than 20% in taurine supplemented media compared to cell culture in non-taurine supplemented media.

PROTEIN PRODUCTION

[00100] In addition to taurine supplemented media and methods of culturing cells in taurine supplemented media, the present invention provides improved methods of producing a protein, such as a therapeutically effective antibody or other biopharmaceutical drug substance, in a cell cultured in taurine supplemented media. The present invention provides a method for producing therapeutic protein in high yield comprising culturing a recombinant cell line in medium containing taurine, wherein the cell line comprises a stably integrated nucleic acid encoding the therapeutic protein.

[00101] In some embodiments, the titer (yield) of protein by mammalian cells cultured in medium containing taurine (taurine supplemented medium) is at least 100 mg/L, at least 0.5 g/L, at least 1 g/L, at least 1.2 g/L, at least 1.4 g/L, at least 1.6 g/L, at least 1.8 g/L, at

least 2 g/L, at least 2.5 g/L greater than the titer of protein by an identical mammalian cell cultured in non-taurine supplemented medium.

[00102] In some embodiments, the protein production yield or titer, which can be expressed in grams of protein product per liter of culture medium, from cells cultured in taurine supplemented medium is at least 100 mg/L, at least 1 g/L, at least 1.2 g/L, at least 1.4 g/L, at least 1.6 g/L, at least 1.8 g/L, at least 2 g/L, at least 2.5 g/L, at least 3 g/L, at least, 3.5 g/L, at least 4 g/L, at least 4.5 g/L, at least 5 g/L, at least 5.5 g/L, at least 6 g/L, at least 6.5 g/L, at least 7 g/L, at least 7.5 g/L, at least 8 g/L, at least 8.5 g/L, at least 9 g/L, at least 9.5 g/L, at least 10 g/L, at least 15 g/L, or at least 20 g/L.

[00103] In some embodiments, the protein titer yielded from cells in taurine supplemented media is at least 2%, at least 3%, at least 4%, at least 5%, at least 6%, at least 7%, at least 8%, at least 9%, at least 10%, at least 11%, at least 12%, at least 13%, at least 14%, at least 15%, at least 16%, at least 17%, at least 18%, at least 19%, at least 20%, at least 21%, at least 22%, at least 23% greater, at least 24% greater, at least 25% greater, at least 26% greater, at least 27% greater, at least 28% greater or at least 29% greater than the protein titer (yield) from similar or identical cells cultured in non-taurine supplemented media.

[00104] In some embodiments, the protein product (protein of interest) is an antibody, a human antibody, a humanized antibody, a chimeric antibody, a monoclonal antibody, a multispecific antibody, a bispecific antibody, an antigen binding antibody fragment, a single chain antibody, a diabody, triabody or tetrabody, a Fab fragment or a F(ab')2 fragment, an IgD antibody, an IgE antibody, an IgM antibody, an IgG antibody, an IgG1 antibody, an IgG2 antibody, an IgG3 antibody, or an IgG4 antibody. In one embodiment, the antibody is an IgG1 antibody. In one embodiment, the antibody is an IgG2 antibody. In one embodiment, the antibody is an IgG4 antibody. In one embodiment, the antibody is a chimeric IgG2/IgG4 antibody. In one embodiment, the antibody is a chimeric IgG2/IgG1 antibody. In one embodiment, the antibody is a chimeric IgG2/IgG1/IgG4 antibody.

[00105] In some embodiments, the antibody is selected from the group consisting of an anti-Programmed Cell Death 1 antibody (e.g. an anti-PD1 antibody as described in U.S. Pat. Appln. Pub. No. US2015/0203579A1), an anti-Programmed Cell Death Ligand-1 (e.g. an anti-PD-L1 antibody as described in in U.S. Pat. Appln. Pub. No. US2015/0203580A1), an anti-Dll4 antibody, an anti-Angiopoetin-2 antibody (e.g. an anti-ANG2 antibody as described in U.S. Pat. No. 9,402,898), an anti- Angiopoetin-Like 3 antibody (e.g. an anti-AngPtl3 antibody as described in U.S. Pat. No. 9,018,356), an anti-platelet derived growth factor receptor antibody (e.g. an anti-PDGFR antibody as described in U.S. Pat. No. 9,265,827), an anti-Erb3 antibody, an anti- Prolactin Receptor antibody (e.g. anti-PRLR antibody as described in U.S. Pat. No. 9,302,015), an anti-Complement 5 antibody (e.g. an

anti-C5 antibody as described in U.S. Pat. Appln. Pub. No US2015/0313194A1), an anti-TNF antibody, an anti-epidermal growth factor receptor antibody (e.g. an anti-EGFR antibody as described in U.S. Pat. No. 9,132,192 or an anti-EGFRvIII antibody as described in U.S. Pat. Appln. Pub. No. US2015/0259423A1), an anti-Proprotein Convertase Subtilisin Kexin-9 antibody (e.g. an anti-PCSK9 antibody as described in U.S. Pat. No. 8,062,640 or U.S. Pat. Appln. Pub. No. US2014/0044730A1), an anti-Growth And Differentiation Factor-8 antibody (e.g. an anti-GDF8 antibody, also known as anti-myostatin antibody, as described in U.S. Pat Nos. 8,871,209 or 9,260,515), an anti-Glucagon Receptor (e.g. anti-GCGR antibody as described in U.S. Pat. Appln. Pub. Nos. US2015/0337045A1 or US2016/0075778A1), an anti-VEGF antibody, an anti-IL1R antibody, an interleukin 4 receptor antibody (e.g an anti-IL4R antibody as described in U.S. Pat. Appln. Pub. No. US2014/0271681A1 or U.S. Pat Nos. 8,735,095 or 8,945,559), an anti-interleukin 6 receptor antibody (e.g. an anti-IL6R antibody as described in U.S. Pat. Nos. 7,582,298, 8,043,617 or 9,173,880), an anti-IL1 antibody, an anti-IL2 antibody, an anti-IL3 antibody, an anti-IL4 antibody, an anti-IL5 antibody, an anti-IL6 antibody, an anti-IL7 antibody, an anti-interleukin 33 (e.g. anti- IL33 antibody as described in U.S. Pat. Appln. Pub. Nos. US2014/0271658A1 or US2014/0271642A1), an anti-Respiratory syncytial virus antibody (e.g. anti-RSV antibody as described in U.S. Pat. Appln. Pub. No. US2014/0271653A1), an anti-Cluster of differentiation 3 (e.g. an anti-CD3 antibody, as described in U.S. Pat. Appln. Pub. Nos. US2014/0088295A1 and US20150266966A1, and in U.S. Application No. 62/222,605), an anti- Cluster of differentiation 20 (e.g. an anti-CD20 antibody as described in U.S. Pat. Appln. Pub. Nos. US2014/0088295A1 and US20150266966A1, and in U.S. Pat. No. 7,879,984), an anti-CD19 antibody, an anti-CD28 antibody, an anti- Cluster of Differentiation-48 (e.g. anti-CD48 antibody as described in U.S. Pat. No. 9,228,014), an anti-Fel d1 antibody (e.g. as described in U.S. Pat. No. 9,079,948), an anti-Middle East Respiratory Syndrome virus (e.g. an anti-MERS antibody as described in U.S. Pat. Appln. Pub. No. US2015/0337029A1), an anti-Ebola virus antibody (e.g. as described in U.S. Pat. Appln. Pub. No. US2016/0215040), an anti-Zika virus antibody, an anti-Lymphocyte Activation Gene 3 antibody (e.g. an anti-LAG3 antibody, or an anti-CD223 antibody), an anti-Nerve Growth Factor antibody (e.g. an anti-NGF antibody as described in U.S. Pat. Appln. Pub. No. US2016/0017029 and U.S. Pat. Nos. 8,309,088 and 9,353,176) and an anti-Activin A antibody. In some embodiments, the bispecific antibody is selected from the group consisting of an anti-CD3 x anti-CD20 bispecific antibody (as described in U.S. Pat. Appln. Pub. Nos. US2014/0088295A1 and US20150266966A1), an anti-CD3 x anti-Mucin 16 bispecific antibody (e.g., an anti-CD3 x anti-Muc16 bispecific antibody), and an anti-CD3 x anti- Prostate-specific membrane antigen bispecific antibody (e.g., an anti-CD3 x anti-PSMA bispecific antibody). In some embodiments, the protein of interest is selected from the group

consisting of alirocumab, sarilumab, fasinumab, nesvacumab, dupilumab, trevogrumab, evinacumab, and rinucumab. All publications mentioned throughout this disclosure are incorporated herein by reference in their entirety.

[00106] In some embodiments, the protein of interest is a recombinant protein that contains an Fc moiety and another domain, (*e.g.,* an Fc-fusion protein). In some embodiments, an Fc-fusion protein is a receptor Fc-fusion protein, which contains one or more extracellular domain(s) of a receptor coupled to an Fc moiety. In some embodiments, the Fc moiety comprises a hinge region followed by a CH2 and CH3 domain of an IgG. In some embodiments, the receptor Fc-fusion protein contains two or more distinct receptor chains that bind to either a single ligand or multiple ligands. For example, an Fc-fusion protein is a TRAP protein, such as for example an IL-1 trap (*e.g.,* rilonacept, which contains the IL-1RAcP ligand binding region fused to the Il-1R1 extracellular region fused to Fc of hIgG1; see U.S. Pat. No. 6,927,004, which is herein incorporated by reference in its entirety), or a VEGF trap (*e.g.,* aflibercept or ziv-aflibercept, which contains the Ig domain 2 of the VEGF receptor Flt1 fused to the Ig domain 3 of the VEGF receptor Flk1 fused to Fc of hIgG1; see U.S. Pat. Nos. 7,087,411 and 7,279,159). In other embodiments, an Fc-fusion protein is a ScFv-Fc-fusion protein, which contains one or more of one or more antigen-binding domain(s), such as a variable heavy chain fragment and a variable light chain fragment, of an antibody coupled to an Fc moiety.

[00107] The present invention is not limited to any particular type of cell for protein production. Examples of cell types suitable for protein production include mammalian cells, insect cells, avian cells, bacterial cells, and yeast cells. The cells may be stem cells or recombinant cells transformed with a vector for recombinant gene expression, or cells transfected with a virus for producing viral products. The cells may contain a recombinant heterologous polynucleotide construct that encodes a protein of interest. That construct can be an episome or it can be an element that is physically integrated into the genome of the cell. The cells may also produce a protein of interest without having that protein encoded on a heterologous polypeptide construct. In other words, the cell may naturally encode the protein of interest, such as a B-cell producing an antibody. The cells may also be primary cells, such as chicken embryo cells, or primary cell lines. Examples of useful cells include BSC cells, LLC-MK cells, CV-1 cells, COS cells, VERO cells, MDBK cells, MDCK cells, CRFK cells, RAF cells, RK cells, TCMK-1 cells, LLCPK cells, PK15 cells, LLC-RK cells, MDOK cells, BHK-21 cells, chicken embryo cells, NS-1 cells, MRC-5 cells, WI-38 cells, BHK cells, 293 cells, RK cells, Per.C6 cells and CHO cells. In various embodiments, the cell line is a CHO cell derviative, such as CHO-K1, CHO DUX B-11, CHO DG-44, Veggie-CHO, GS-CHO, S-CHO, or CHO lec mutant lines.

[00108] In one embodiment, the cell, which is a CHO cell, ectopically expresses a protein. In one embodiment, the protein comprises an immunoglobulin heavy chain region, such as a CH1, CH2, or CH3 region. In one embodiment, the protein comprises a human or rodent immunoglobulin CH2 and CH3 region. In one embodiment, the protein comprises a human or rodent immunoglobulin CH1, CH2, and CH3 region. In one embodiment, the protein comprises a hinge region and a CH1, CH2, and CH3 region. In one embodiment, the protein comprises an immunoglobulin heavy chain variable domain. In one embodiment, the protein comprises an immunoglobulin light chain variable domain. In one embodiment, the protein comprises an immunoglobulin heavy chain variable domain and an immunoglobulin light chain variable domain. In one embodiment, the protein is an antibody, such as a human antibody, a rodent antibody, or a chimeric human/rodent antibody (*e.g.,* human/mouse, human/rat, or human hamster).

[00109] A production phase can be conducted at any scale of culture, from shaker flasks or wave bags, to one-liter bioreactors, and to large scale industrial bioreactors. Likewise, a seed train expansion phase can be conducted at any scale of culture, from and shaker flasks or wave bags, to one-liter or larger bioreactors. A large scale process can be conducted in a volume of about 100 liters to 20,000 liters or more. One or more of several means may be used to control protein production, such as temperature shift or chemical induction. A growth phase may occur at a higher temperature than a production phase. For example, a growth phase may occur at a first temperature of about 35°C to 38°C, and a production phase may occur at a second temperature of about 29°C to 37°C, optionally from about 30°C to 36°C or from about 30°C to 34°C. In addition, chemical inducers of protein production, such as caffeine, butyrate, tamoxifen, estrogen, tetracycline, doxycycline, and hexamethylene bisacetamide (HMBA), may be added concurrent with, before, or after a temperature shift. If inducers are added after a temperature shift, they can be added from one hour to five days after the temperature shift, such as from one to two days after the temperature shift. Production cell cultures may be run as continuous feed culture system, as in a chemostat (see C. Altamirano *et al.,* 2001 *supra*), or according to a fed-batch process (Huang, 2010 *supra*).

[00110] The invention is useful for improving protein production via cell culture processes. The cell lines used in the invention can be genetically engineered to express a polypeptide of commercial or scientific interest. Genetically engineering the cell line involves transfecting, transforming or transducing the cells with a recombinant polynucleotide molecule, or otherwise altering (*e.g.,* by homologous recombination and gene activation or fusion of a recombinant cell with a non-recombinant cell) so as to cause the host cell to express a desired recombinant polypeptide. Methods and vectors for genetically engineering

cells or cell lines to express a polypeptide of interest are well known to those of skill in the art; for example, various techniques are illustrated in Current Protocols in Molecular Biology. Ausubel et al., eds. (Wiley & Sons, New York, 1988, and quarterly updates); Sambrook et al., Molecular Cloning: A Laboratory Manual (Cold Spring Laboratory Press, 1989); Kaufman, R. J., Large Scale Mammalian Cell Culture, 1990, pp. 15-69. A wide variety of cell lines suitable for growth in culture are available from the American Type Culture Collection (Manassas, Va.) and commercial vendors. Examples of cell lines commonly used in the industry include VERO, BHK, HeLa, CVI (including Cos), MDCK, 293, 3T3, myeloma cell lines (e.g., NSO, NSI), PC12, WI38 cells, and Chinese hamster ovary (CHO) cells. CHO cells are widely used for the production of complex recombinant proteins, such as cytokines, clotting factors, and antibodies (Brasel et al. (1996), Blood 88:2004-2012; Kaufman et al. (1988), J.Biol Chem 263:6352-6362; McKinnon et al. (1991), J Mol Endocrinol 6:231-239; Wood et al. (1990), J Immunol. 145:3011-3016). The dihydrofolate reductase (DHFR)-deficient mutant cell lines (Urlaub et al. (1980), Proc Natl Acad Sci USA 77: 4216-4220), DXBl 1 and DG-44, are desirable CHO host cell lines because the efficient DHFR selectable and amplifiable gene expression system allows high level recombinant protein expression in these cells (Kaufman RJ. (1990), Meth Enzymol 185:537-566). In addition, these cells are easy to manipulate as adherent or suspension cultures and exhibit relatively good genetic stability. CHO cells and the proteins recombinantly expressed by them have been extensively characterized and have been approved for use in clinical and commercial manufacturing by regulatory agencies. In some embodiments, the CHO cell lines are cell lines as described in U.S. Patent Application Publication Nos. 2010/0304436 A1, 2009/0162901 A1 and 2009/0137416 A1, and U.S. Patent Nos. 7,455,988 B2, 7,435,553 B2, and 7,105,348 B2.

[00111] The present invention is not limited in scope by the specific embodiments described herein, which are intended as illustrations of individual aspects or embodiments of the invention. Functionally equivalent methods and components are within the scope of the invention. Various modifications of the invention, in addition to those described here, are apparent to those skilled in the art from the foregoing description and accompanying drawings. Such modifications fall within the scope of the invention.

EXAMPLES

EXAMPLE 1: Improved Antibody Titers Due To Taurine Supplementation

[00112] **Example 1A - High-Throughput Shake Flask Culture**: 250mL shake flasks were inoculated from a seed culture of a monoclonal antibody (Ab1) producing cell line derived from CHO-K1. The inoculated cells were grown at 35.5ºC for seventeen days and

fed glucose and other supplemental nutrients as needed. Cells were grown in chemically defined (hydrolysate-free and serum-free) base media.

[00113] Each culture flask was either unsupplemented (Flask 1a), or supplemented with 1 mM taurine at day 0 (Flask 1b).

TABLE 2: Average 17-Day Antibody Titers (g/L) and ApproximateTiter Increase (%) Relative to Baseline

Flask	Medium Supplement	Ab1 Titer	
1a	Unsupplemented*	7.3 g/L	
1b	Taurine	7.9 g/L^	8%

*Baseline control for % titer increase; Flask 1b compared to titer in unsupplemented media (Flask 1a).

^Difference in final titer between unsupplemented and supplemented culture is statistically significant ($p < 0.05$).

[00114] Titer values were calculated from protein harvested on day 17, and are statistically significant ($p < 0.05$) compared to baseline. Taurine-supplemented cultures exhibit an overall 8% increase in final protein titer over unsupplemented cultures.

[00115] **Example 1B – Benchtop-Scale Bioreactors**: In a similar example, yet on a larger scale of production, 2L bioreactors were inoculated from a seed culture of a monoclonal antibody (Ab2, Ab3 or Ab4) producing cell line derived from CHO-K1. The inoculated cultures were grown at a temperature of 35.5 ºC, DO set point of 40.4% and air sparge of 22 ccm for 14 days. Ab2 and Ab3 processes had pH setpoints of 7.0 ± 0.15, while the Ab4 process had a pH setpoint of 7.13 ± 0.27. Glucose, antifoam and basal feed were supplied to the bioreactors as needed. Cultures were grown in unsupplemented medium (Bioreactor 2a, 3a, 4a) or grown in about 1 mM taurine-supplemented medium (Ab2 and Ab3) or about 3 mM taurine-supplemented medium (Ab4), added on day 0 of production (Bioreactors 2b, 3b and4b, respectively).

[00116] Antibody yield (titer) was 6.4 g/L for Ab2-producing cells, yet the cells grown with taurine yielded 8 g/L protein. The 24% increase in titer compared to cells grown without taurine supplementation is statistically significant ($p < 0.05$). The resulting final titers for Ab3-producing cultures and Ab4-producing cultures are also significantly higher ($p < 0.05$) after 14 days (11% and 20%, respectively), compared to non-taurine supplemented cultures. See Table 3.

TABLE 3: Average 14-Day Antibody Titers (g/L) and Approximate Titer Increase (%) Relative to Baseline

Medium Supplement	Bio-reactor#	Ab2 Titer		Bio-reactor#	Ab3 Titer		Bio-reactor#	Ab4 Titer	
Unsupplemented*	2a	6.4 g/L		3a	6.6 g/L		4a	4.4 g/L	
Taurine	2b	8 g/L^	24%	3b	7.3 g/L^	11%	4b	5.3 g/L^	20%

*Unsupplemented medium is the baseline control for % titer increase, where Bioreactors 2b, 3b, or 4b % titer increase is compared to titer in unsupplemented media (Bioreactors 2a, 3a, or 4a, respectively).

^Differences in final titer between supplemented and unsupplemented cultures are statistically significant ($p < 0.05$).

[00117] A timecourse with regard to protein titer was plotted for the Ab3-producing cell culture and significant improvement in protein titer due to taurine supplementation was observed at each day of culture, starting at day 6.

TABLE 4: Antibody Titer (g/L) Improvement Due to Taurine Supplementation at Representative Timepoints

Bioreactor	Media Supplement	Ab3 Titer at day 6		Ab3 Titer at day 9		Ab3 Titer at day 14	
3a	Unsupplemented*	1.7 g/L		4.1 g/L		6.6 g/L	
3b	Taurine	1.9 g/L	12%	5.3 g/L^	29%	7.3 g/L^	11%

*Approximate increase (%) compared to unsupplemented medium collected on same day
^Increase in titer with taurine supplementation is statistically significant ($p < 0.05$) compared to unsupplemented culture.

[00118] A significant improvement in titer could be seen in production culture as early as day 6 (12% increase compared to the same culture without taurine supplementation). See also Figure 1. The maximum difference in this timecourse was seen at day 9 (significant ($p < 0.05$) increase of 29% in Bioreactor 3b compared to 3a), and significant ($p < 0.05$) titer increase of 11% was observed on the final day (14) of culture.

[00119] The protein production benefits of taurine-supplementation are observed across different scales (Example 1A and 1B) and different cell lines (Example 1B).

EXAMPLE 2: Consistent Productivity with Varying Taurine Concentrations in a High-Throughput Shake Flask Culture

[00120] Consistency of the protein titer was tested by varying the amount of taurine added to the culture at production day 0. 250 mL shake flasks were inoculated from a seed culture of a monoclonal antibody (Ab1) producing cell line derived from CHO-K1. The inoculated cells were grown at 35.5ºC for fourteen days and fed glucose and other supplemental nutrients as needed. Cells were grown in chemically defined (hydrolysate-free and serum-free) base media.

[00121] Each culture contained either no taurine (unsupplemented) or taurine at 0.1 mM, 0.3 mM, 0.5 mM, 0.7 mM, 1 mM, 3 mM, 5 mM, 7.5 mM or 10 mM concentrations.

TABLE 5: Average 14-Day Antibody Titers (g/L) for Cultures Supplemented with 0.1 to 10 mM Taurine

Shake Flask	**Media Supplement**	**Ab1 Titer**	
5a	Unsupplemented*	6.5 g/L	
5b	0.1 mM Taurine[#]	6.7 g/L	3%
5c	0.3 mM Taurine^	6.8 g/L	5%
5d	0.5 mM Taurine^	6.9 g/L	6%
5e	0.7 mM Taurine^	7.0 g/L	8%
5f	1 mM Taurine^	7.0 g/L	8%
5g	5 mM Taurine^	7.1 g/L	9%
5h	7.5 mM Taurine^	7.1 g/L	9%
5i	10 mM Taurine^	7.1 g/L	9%

*Unsupplemented medium is the baseline control for % titer increase.

[#]Difference in final titer is statistically significance compared to unsupplemented control

($p < 0.1$).

^Difference in final titer is statistically significance compared to unsupplemented control ($p < 0.05$).

[00122] It is shown that varying the amount of taurine-supplementation consistently produces high titers, when taurine is supplemented in a range of at least 0.1 mM to 10 mM. Final titers for the taurine supplemented conditions were statistically different from the unsupplemented condition. For 0.1 mM taurine, $p < 0.1$ while $p < 0.05$ for 0.3 mM to 10 mM taurine.

EXAMPLE 3: Testing Varying Taurine Feeding Schedules in a High-Throughput Shake Flask Culture

[00123] **EXAMPLE 3A: Addition of Taurine during Seed Train Expasion Phase:**

[00124] The benefits of adding taurine to the culture during the expansion seed train phase were assessed in the high-throughput shake flask model. In flask 6a (Table 6), the Ab1-producing CHO cells were thawed in chemically defined (hydrolysate-free and serum-free) base media supplemented with 1 mM taurine. Taurine concentration of basal medium was maintained at 1 mM throughout the expansion phase. During production, the culture basal medium was supplemented with 1 mM taurine on day 0. Glucose and nutrient basal feed were supplied as needed during the 17 day production.

[00125] Flask 6b cells grew in taurine-free (unsupplemented) chemically defined (hydrolysate-free and serum-free) basal medium throughout the seed train expansion phase. At day 0 of production, the culture basal medium was supplemented with 1 mM taurine. For the 17 day production, glucose and nutrient basal feeds were supplied as needed.

TABLE 6: Average 17-Day Antibody Titers for Cultures Supplemented with 1 mM Taurine during Different Phases of the Process

Shake Flask	**Addition of 1 mM Taurine**	**Ab1 Titer**
6a	Seed Train and Production Phases	7.7 g/L
6b	Only Production Phase	7.8 g/L

Differences in final titer (day 17) are not statistically significant ($p > 0.1$).

[00126] Final (day 17) titer values for both conditions (taurine supplementation in production only or seed train and production combined) are similar. Resulting titers are not statistically significant ($p > 0.1$). The benefit of adding taurine in the seed train expansion phase is analogous to supplementing taurine in the production phase.

[00127] **EXAMPLE 3B: Varying Taurine Feeding Schedules during Production Phase:** To determine whether varying standard feeding schedules of taurine had any effect on the protein titer for taurine-supplemented cultures, additional experiments were conducted in analogous shake flask cultures growing Ab1-producing CHO cells. The cells were subjected to varying culture conditions similar to Example 2, where the feeding schedule was the same as before, glucose/nutrient basal feed was added as needed.

[00128] Ab1-producing cultures were supplemented with a total of 5 mM taurine. Similar productivity (7.1 g/L, 6.8 g/L and 7.0 g/L) is observed in varying taurine feeding schedules. Titer values as compared in this experiment are not statistically different ($p > 0.1$) (see Table 7).

TABLE 7: Average 14-Day Antibody Titers (g/L) for Cultures Supplemented with 5mM Taurine with Varying Schedules

Taurine Schedule	**Ab1 Day 14 Titer**
5 mM day 0	7.1 g/L
1 mM days 0, 3, 5, 7, 10 (5 mM total)	6.8 g/L
1 mM day 0; 2 mM days 7, 10 (5 mM total)	7.0 g/L

Differences between day 14 titer values are not statistically significant ($p > 0.1$).

[00129] The feeding schedules of taurine do not have any negative effect, nor alter the outcome where taurine-supplementation is beneficial to product yield. Thus, taurine supplementation may be added once at day 0, or added on subsequent days of the production phase, or may be added at multiple intervals during the production phase.

EXAMPLE 4: Measuring Ammonia Byproduct in a High-Throughput Shake Flask Culture

[00130] Ammonia by-product was measured following 14-day cultures conducted in an analogous manner as Example 2 for taurine-supplemented cultures of Ab1-producing CHO cells. The cells were subjected to varying culture conditions similar to above where glucose/nutrient base feed was added as needed.

TABLE 8: Average 17-Day Ammonia (mM) and Decrease (%)

Media Supplement	**Ab1 Ammonia**	
Unsupplemented*	2.56 mM	
Taurine	1.73 mM^	-32%

* Baseline control for % ammonia decrease; taurine supplemented condition compared to ammonia in unsupplemented medium.

^Decrease in ammonia concentration is statistically significant ($p < 0.1$).

[00131] In the Ab1-producing cells, taurine supplementation in the medium supports a healthy, sustainable culture where the ammonia by-product has been reduced by 32%. The decrease in ammonia concentration from taurine supplementation is statistically significant ($p < 0.1$).

[00132] The present invention may be embodied in other specific embodiments.

CLAIMS

1. A method for culturing recombinant eukaryotic cells for improved recombinant protein production, comprising the steps of: (a) propagating or maintaining cells in a defined cell culture medium during growth phase, and (b) supplementing the base cell culture medium with 0.1 mM to 10 mM L-taurine and 0.09 mM to 0.9 mM ornithine and expressing a recombinant protein of interest during production phase, wherein the addition of L-taurine increases the titer of the recombinant protein of interest by at least 3% when compared to cells expressing the protein of interest in a cell culture medium containing less than 0.1 mM L-taurine.

2. The method of claims 1, 28, or 29 wherein the supplements of (b) are provided from 1 to 5 times during production phase.

3. The method of claims 1, 28, or 29 wherein the supplements of (b) are provided on each day for the duration of the production phase.

4. The method of claims 1, 28, or 29 further comprising supplementing the culture in a defined cell culture medium with 0.1 mM to 10 mM L-taurine during growth phase.

5. The method of claims 1, 28, or 29 wherein the eukaryotic cell is selected from the group consisting of mammalian cell, avian cell, insect cell, and yeast cell.

6. The method of claim 5, wherein the cell is selected from the group consisting of CHO (e.g. CHO K1, DXB-11 CHO, Veggie-CHO), COS (e.g. COS-7), retinal cell, Vero, CV1, kidney (e.g. HEK293, 293 EBNA, MSR 293, MDCK, HaK, BHK21), HeLa, HepG2, WI38, MRC 5, Colo25, HB 8065, HL-60, lymphocyte (e.g. Jurkat, Daudi), A431 (epidermal), CV-1, U937, 3T3, L cell, C127 cell, SP2/0, NS-0, MMT cell, PER.C6® cell, stem cell, tumor cell, and a cell line derived from an aforementioned cell.

7. The method of claim 6, wherein the cell is a CHO cell.

8. The method of claims 1, 28, or 29 wherein the protein of interest is an antigen binding protein.

9. The method of claims 1, 28, or 29 wherein the protein of interest comprises an Fc domain.

10. The method of claim 8, wherein the protein of interest is selected from the group consisting of an Fc-fusion protein, a receptor-Fc-fusion protein (TRAP), an antibody, an antibody fragment, and a ScFv-Fc fusion protein.

11. The method of claim 10, wherein the protein of interest is selected from the group consisting of an anti-PD1 antibody, an anti-PDL-1 antibody, an anti-Dll4 antibody, an anti-ANG2 antibody, an anti-AngPtl3 antibody, an anti-PDGFR antibody, an anti-Erb3 antibody, an anti-PRLR antibody, an anti-TNF antibody, an anti-EGFR antibody, an anti-PCSK9 antibody, an anti-GDF8 antibody, an anti-GCGR antibody, an anti-VEGF antibody, an anti-IL1R antibody, an anti-IL4R antibody, an anti-IL6R antibody, an anti-IL1 antibody, an anti-IL2 antibody, an anti-IL3 antibody, an anti-IL4 antibody, an anti-IL5 antibody, an anti-IL6 antibody, an anti-IL7 antibody, an anti-RSV antibody, an anti-NGF antibody, an anti-CD3 antibody, an anti-CD20 antibody, an anti-CD19 antibody, an anti-CD28 antibody, an anti-CD48 antibody, an anti-CD3/anti-CD20 bispecific antibody, an anti-CD3/anti-MUC16 bispecific antibody, and an anti-CD3/anti-PSMA bispecific antibody.

12. The method of claim 10, wherein the protein of interest is selected from the group consisting of alirocumab, sarilumab, fasinumab, nesvacumab, dupilumab, trevogrumab, evinacumab, and rinucumab.

13. A method for producing a recombinant protein of interest comprising the steps of:

(a) introducing into a cell or cells a nucleic acid comprising a nucleotide sequence encoding a protein of interest;

(b) selecting the cell(s) expressing the protein of interest;

(c) culturing the selected cell(s) in a cell culture medium comprising 0.1 mM to 10 mM L-taurine and 0.09 mM to 0.9 mM ornithine; and

(d) producing the protein of interest in the cell, wherein the protein of interest is secreted into the medium, wherein the addition of L-taurine increases the titer of the recombinant protein of interest by at least 3% when compared to cells expressing the protein of interest in a cell culture medium containing less than 0.1 mM L-taurine.

14. The method of claims 13, 30, or 31 wherein the cell is a CHO cell, HEK293 cell or BHK cell.

15. The method of claims 13, 30, or 31 wherein the protein of interest is an antigen-binding protein.

16. The method of claims 13, 30, or 31 wherein the protein of interest comprises an Fc domain.

17. The method of claims 13, 30, or 31 wherein the protein of interest is selected from the group consisting of an Fc-fusion protein, a receptor-Fc-fusion protein (TRAP), an antibody, and an antibody fragment.

18 The method of claim 17, wherein the protein of interest is selected from the group consisting of an anti-PD1 antibody, an anti-PDL-1 antibody, an anti-Dll4 antibody, an anti-ANG2 antibody, an anti-AngPtl3 antibody, an anti-PDGFR antibody, an anti-Erb3 antibody, an anti-PRLR antibody, an anti-TNF antibody, an anti-EGFR antibody, an anti-PCSK9 antibody, an anti-GDF8 antibody, an anti-GCGR antibody, an anti-VEGF antibody, an anti-IL1R antibody, an anti-IL4R antibody, an anti-IL6R antibody, an anti-IL1 antibody, an anti-IL2 antibody, an anti-IL3 antibody, an anti-IL4 antibody, an anti-IL5 antibody, an anti-IL6 antibody, an anti-IL7 antibody, an anti-RSV antibody, an anti-NGF antibody, an anti-CD3 antibody, an anti-CD20 antibody, an anti-CD19 antibody, an anti-CD28 antibody, an anti-CD48 antibody, an anti-CD3/anti-CD20 bispecific antibody, an anti-CD3/anti-MUC16 bispecific antibody, and an anti-CD3/anti-PSMA bispecific antibody.

19. The method of claim 17, wherein the protein of interest is selected from the group consisting of alirocumab, sarilumab, fasinumab, nesvacumab, dupilumab, trevogrumab, evinacumab, and rinucumab.

20. A method for producing a protein of interest in a taurine-supplemented culture medium, comprising the steps of:

(a) introducing into a cell a nucleic acid comprising a sequence encoding a protein of interest;

(b) selecting a cell or cells expressing the protein of interest;

(c) culturing the selected cell(s) in a cell culture medium;

(d) supplementing the cell culture medium with taurine in an amount of 0.1 mM to 10 mM and ornithine in an amount of 0.09 mM to 0.9 mM;

(e) maintaining the cell culture under taurine supplementation conditions of (d) for at least 6 days, wherein the addition of L-taurine increases the titer of the recombinant protein of interest by at least 3% when compared to cells expressing the protein of interest in a cell culture medium containing less than 0.1 mM L-taurine, wherein the protein of interest is secreted into the medium; and

(f) harvesting the protein of interest.

21. The method of claims 20, 32, or 33 wherein the harvested protein has a protein titer that is at least 8%, 9%, 10%, 11%, 12%, 13%, 14%, 15%, or at least 20% higher than the titer of a comparator control culture wherein the comparator control culture medium has not been subjected to the taurine supplementation conditions of (d).

22. A method for producing at least 1 g/L of a recombinant protein of interest comprising culturing a recombinant cell line in a cell culture medium comprising at least 0.1 mM L-taurine and at least 0.09 mM ornithine, wherein the cell line comprises a stably integrated nucleic acid encoding the recombinant protein, wherein the addition of L-taurine increases the titer of the recombinant protein of interest by at least 3% when compared to cells expressing the protein of interest in a cell culture medium containing less than 0.1 mM L-taurine.

23. The method of claims 22, 34, or 35 wherein yield of the recombinant protein of interest was increased by the inclusion of taurine in the medium compared to a cell line cultured in a cell culture medium that does not include L-taurine.

24. The method of claims 22, 34, or 35 wherein the protein of interest is selected from the group consisting of an Fc-fusion protein, a receptor-Fc-fusion protein (TRAP), an antibody, and an antibody fragment.

25. The method of claim 24, wherein the protein of interest is selected from the group consisting of an anti-PD1 antibody, an anti-PDL-1 antibody, an anti-Dll4 antibody, an anti-ANG2 antibody, an anti-AngPtl3 antibody, an anti-PDGFR antibody, an anti-Erb3 antibody, an anti-PRLR antibody, an anti-TNF antibody, an anti-EGFR antibody, an anti-PCSK9 antibody, an anti-GDF8 antibody, an anti-GCGR antibody, an anti-VEGF antibody, an anti-IL1R antibody, an anti-IL4R antibody, an anti-IL6R antibody, an anti-IL1 antibody, an anti-IL2 antibody, an anti-IL3 antibody, an anti-IL4 antibody, an anti-IL5 antibody, an anti-IL6 antibody, an anti-IL7 antibody, an anti-RSV antibody, an anti-NGF antibody, an anti-CD3 antibody, an anti-CD20 antibody, an anti-CD19 antibody, an anti-CD28 antibody, an anti-CD48 antibody, an anti-CD3/anti-CD20 bispecific antibody, an anti-CD3/anti-MUC16 bispecific antibody, and an anti-CD3/anti-PSMA bispecific antibody.

26. The method of claim 24, wherein the protein of interest is selected from the group consisting of alirocumab, sarilumab, fasinumab, nesvacumab, dupilumab, trevogrumab, evinacumab, and rinucumab.

27. The method of claim 24, wherein the production method is capable of increasing protein yield by at least 0.1 g/L, at least 0.5 g/L, at least 1 g/L, at least 1.2 g/L, at least 1.4 g/L, at least 1.6 g/L, at least 1.8 g/L, at least 2 g/L, at least 2.2 g/L, at least 2.4 g/L, or at least 2.5 g/L compared to a similar production method in a cell culture medium that contains less than 0.1 mM taurine.

28. A method for culturing recombinant eukaryotic cells for improved recombinant protein production, comprising the steps of: (a) propagating or maintaining cells in a defined cell culture medium during growth phase, and (b) supplementing the base cell culture medium with 0.1 mM to 10 mM L-taurine and 0.20 mM to 0.714 mM putrescine and expressing a recombinant protein of interest during production phase, wherein the addition of L-taurine increases the titer of the recombinant protein of interest by at least 3% when compared to cells expressing the protein of interest in a cell culture medium containing less than 0.1 mM L-taurine.

29. A method for culturing recombinant eukaryotic cells for improved recombinant protein production, comprising the steps of: (a) propagating or maintaining cells in a defined cell culture medium during growth phase, and (b) supplementing the base cell culture medium with ~~about~~ 0.1 mM to 10 mM L-taurine, 0.09 mM to 0.9 mM ornithine, and 0.20 mM to 0.714 mM putrescine and expressing a recombinant protein of interest during production phase, wherein the addition of L-taurine increases the titer of the recombinant protein of interest by at least 3% when compared to cells expressing the protein of interest in a cell culture medium containing less than 0.1 mM L-taurine.

30. A method for producing a recombinant protein of interest comprising the steps of:

(a) introducing into a cell or cells a nucleic acid comprising a nucleotide sequence encoding a protein of interest;

(b) selecting the cell(s) expressing the protein of interest;

(c) culturing the selected cell(s) in a cell culture medium comprising 0.1 mM to 10 mM L-taurine and 0.20 mM to 0.714 mM putrescine; and

(d) producing the protein of interest in the cell, wherein the protein of interest is secreted into the medium, wherein the addition of L-taurine increases the titer of the recombinant protein of interest by at least 3% when compared to cells expressing the protein of interest in a cell culture medium containing less than 0.1 mM L-taurine.

31. A method for producing a recombinant protein of interest comprising the steps of:

(a) introducing into a cell or cells a nucleic acid comprising a nucleotide sequence encoding a protein of interest;

(b) selecting the cell(s) expressing the protein of interest;

(c) culturing the selected cell(s) in a cell culture medium comprising 0.1 mM to 10 mM L-taurine, 0.09 mM to 0.9 mM ornithine, and 0.20 mM to 0.714 mM putrescine; and

(d) producing the protein of interest in the cell, wherein the protein of interest is secreted into the medium, wherein the addition of L-taurine increases the titer of the recombinant protein of interest by at

least 3% when compared to cells expressing the protein of interest in a cell culture medium containing less than 0.1 mM L-taurine.

32. A method for producing a protein of interest in a taurine-supplemented culture medium, comprising the steps of:

(a) introducing into a cell a nucleic acid comprising a sequence encoding a protein of interest;

(b) selecting a cell or cells expressing the protein of interest;

(c) culturing the selected cell(s) in a cell culture medium;

(d) supplementing the cell culture medium with taurine in an amount of 0.1 mM to 10 mM and putrescine in an amount of 0.20 mM to 0.714 mM;

(e) maintaining the cell culture under taurine supplementation conditions of (d) for at least 6 days, wherein the addition of L-taurine increases the titer of the recombinant protein of interest by at least 3% when compared to cells expressing the protein of interest in a cell culture medium containing less than 0.1 mM L-taurine, wherein the protein of interest is secreted into the medium; and

(f) harvesting the protein of interest.

33. A method for producing a protein of interest in a taurine-supplemented culture medium, comprising the steps of:

(a) introducing into a cell a nucleic acid comprising a sequence encoding a protein of interest;

(b) selecting a cell or cells expressing the protein of interest;

(c) culturing the selected cell(s) in a cell culture medium;

(d) supplementing the cell culture medium with taurine in an amount of 0.1 mM to 10 mM, ornithine in an amount of 0.09 mM to 0.9 mM, and putrescine in an amount of 0.20 mM to 0.714 mM;

(e) maintaining the cell culture under taurine supplementation conditions of (d) for at least 6 days, wherein the addition of L-taurine increases the titer of the recombinant protein of interest by at least 3% when compared to cells expressing the protein of interest in a cell culture medium containing less than 0.1 mM L-taurine, wherein the protein of interest is secreted into the medium; and

(f) harvesting the protein of interest.

34. A method for producing at least 1 g/L of a recombinant protein of interest comprising culturing a recombinant cell line in a cell culture medium comprising at least 0.1 mM L-taurine and at least 0.20 mM putrescine, wherein the cell line comprises a stably integrated nucleic acid encoding the recombinant protein, wherein the addition of L-taurine increases the titer of the recombinant protein of interest by at least 3% when compared to cells expressing the protein of interest in a cell culture medium containing less than 0.1 mM L-taurine.

35. A method for producing at least 1 g/L of a recombinant protein of interest comprising culturing a recombinant cell line in a cell culture medium comprising at least 0.1 mM L-taurine, at least 0.09 mM ornithine, and at least 0.20 mM putrescine, wherein the cell line comprises a stably integrated nucleic acid encoding the recombinant protein, wherein the addition of L-taurine increases the titer of the recombinant protein of interest by at least 3% when compared to cells expressing the protein of interest in a cell culture medium containing less than 0.1 mM L-taurine.

36. The method of claims 1, 28 or 29, wherein the addition of L-taurine reduces the ammonia byproduct level by at least 4% compared to cells expressing the recombinant protein of interest in a cell culture medium containing less than 0.1 mM L-taurine.

37. The method of claims 13, 30 or 31, wherein the addition of L-taurine reduces the ammonia byproduct level by at least 4% compared to cells expressing the recombinant protein of interest in a cell culture medium containing less than 0.1 mM L-taurine.

38. The method of claims 22, 34, or 35, wherein the addition of L-taurine reduces the ammonia byproduct level by at least 4% compared to cells expressing the recombinant protein of interest in a cell culture medium containing less than 0.1 mM L-taurine.

39. The method of claims 1, 28 or 29, wherein the titer of the recombinant protein of interest cultured in the media containing 0.1 mM to 10 mM L-taurine supplement is at least 1.8 g/L.

40. The method of claims 13, 30 or 31, wherein the titer of the recombinant protein of interest cultured in the media containing 0.1 mM to 10 mM L-taurine supplement is at least 1.8 g/L.

41. The method of claims 22, 34, or 35, wherein the titer of the recombinant protein of interest cultured in the media containing 0.1 mM to 10 mM L-taurine supplement is at least 1.8 g/L.
