

## ABSTRACT

An inner circumferential stator winding (21) of a ceiling fan includes  
a first inner circumferential stator winding (22) and a second inner  
5 circumferential stator winding (23). A terminal of an outer circumferential  
stator winding (19) passes through an upper surface of a first terminal block  
(24) and connects with a corresponding power source line (6). A terminal of  
the first inner circumferential stator winding (22) and a terminal of the  
second inner circumferential stator winding (23) pass through an upper  
10 surface of a second terminal block (25) and connect with corresponding  
power source lines (6).
