

[Document type] Abstract

[Title of the Invention]

Computer apparatus, and method and program for setting security
for computer apparatus

[Abstract]

[Object]

A technology is provided that can ensure that setting changes
are made according to environments to always provide a highly
secure environment for network connection.

[Constitution]

In a PC, Bluetooth is used to search the BD addresses of
devices in the vicinity of the PC to determine the environment
in which the PC is used and automatically change the security
level of the PC based on the using environment. Furthermore,
if the PC is in an environment for which the security level
"home" or "office" should be set but devices that would be
found in that environment cannot be detected in the process for
determining the environment, the highest security level,
"mobile," is set.
