Technical Field

5

The invention relates to an oral pharmaceutical composition comprising a proton pump inhibitor (PPI) and is designed for the treatment of gastric acid related diseases in animals.

10

Background of the Invention

Proton pump inhibitors are potent inhibitors of gastric acid secretion and are used for the treatment of gastric acid related diseases in humans, such as for instance gastric and duodenal ulcers. These substances are susceptible to

15 degradation/transformation in acid reacting and neutral media. Pharmaceutical formulations for oral administration to humans are preferably enteric-coated. These formulations are sensitive to moisture and must be stored in well-closed, tight containers during long-term storage.

20

Peptic ulcer diseases are common also in some animals, especially in horses and camels. Other animals of interest for treatment of peptic ulcer diseases are for example dolphins, sea-lions, llamas, dogs, cats and pigs. By gastro-endoscopic evaluation of horses, ulcers have been found in the squamous mucosa, the non glandular fundus, the glandular stomach and the duodenum. The aetiology of

25 gastro-duodenal ulcers in the equine species is mainly unknown but stress appears to play an important role in some cases.

30

Anti-ulcer compounds such as for instance histamine-2-receptor antagonists have reportedly been administered several times a day to horses by oral or naso-gastric tubes. This procedure can be traumatic and may require light sedation of the horse. Trained persons are required for the administration.

This Sheet Has Been Replaced

THIS SHEET HAS BEEN
REPLACED

Omeprazole and other proton pump inhibitors are potent inhibitors of gastric acid secretion in animals. They block the production of gastric acid by inhibition of H^+K^+ -ATPase, the enzyme responsible for the production of hydrogen ions in the parietal cells. The proton pump inhibitors cause profound acid suppression and
5 unlike most other anti-ulcer compounds such as for instance the H_2 -blockers, omeprazole can be given once daily. According to the present invention enteric-coated beads containing omeprazole in a gel formulation can easily be applied onto the dorsal part of the tongue of the horse during field conditions and is well accepted by the horses.

10

Such a moist gel comprising enteric-coated beads of proton pump inhibitors is not stable during long-term storage at room temperature and must be prepared ex tempore. To-day there exist no such formulation on the market.

15

Omeprazole, 5-methoxy-2(((4-methoxy-3,5-dimethyl-2-pyridinyl)methyl)sulfinyl)-1H-benzimidazole, is disclosed in European patent no 5129 as a potent inhibitor of gastric acid secretion.

20

Lansoprazole, 2-[[[3-methyl-4-(2,2,2-trifluoroethoxy)-2-pyridyl]methyl]sulfinyl]-1H-benzimidazole, is disclosed in European patent no 174 726 as a potent inhibitor of gastric acid secretion.

25

Pantoprazole is disclosed in European patent no 166 287 as a potent inhibitor of gastric acid secretion.

Leminoprazole is disclosed in UK patent no 2 163 747.

Detailed description of the invention

- The object of the present invention is to provide oral pharmaceutical compositions for easy administration to horses and other animals. The proton pump inhibitor is in the form of dry particles, such as beads or tablets, which are coated with one or more coatings one of which is an enteric-coating. The beads or tablets can be prepared by compaction, crystallisation, applying a solution or suspension of the proton pump inhibitor onto inert cores, extrusion and spheronisation or similar processes. The enteric-coated beads or tablets are mixed with dry gelling agent(s), such as for instance xanthan gum, guar gum, locust bean gum, tragacanth, modified cellulose derivatives or similar gel forming compounds. When water is added to this mixture a paste-like gel is formed. The gel is for example applied dorsally at the tongue of the animal such as a horse with a suitable applicator.
- Proton pump inhibitors used in the compositions of the invention are compounds of the general formula I

wherein R_a is

The proton pump inhibitors used in the compositions of the invention may be used in neutral form or in the form of a basic salt, such as for instance the Mg^{2+} , Ca^{2+} , Na^+ , or K^+ salts, preferably the Mg^{2+} or Na^+ salts. Further where applicable, a compound listed above may be used in racemic form or in the form of a substantially pure enantiomer.

In one embodiment of the invention the enteric-coated particles are mixed with suitable substances, such as for instance suitable inorganic or organic water soluble salts of potassium, calcium, magnesium or aluminium. When a water solution of a suitable polymeric compound or compounds, such as for instance kappa-carrageenan, pectin, anionic polymers known to give gels with positively charged metal ions, or similar compounds, is added to the mixture a paste-like gel is formed through the interaction of the ions with the polymers.

In another embodiment of the invention the enteric-coated particles are mixed with

suitable constituents. When a low-viscous solution of a temperature-sensitive polymer, such as for instance ethylhydroxyethylcellulose (EHEC) or polyethylenepolypropylene glycols or similar substances, is added and the system is warmed to temperatures of 33-35°C or higher a viscous paste-like gel is formed.

5

In still another embodiment of the invention the enteric-coated particles are mixed with suitable substances in the form of gelforming agents, such as dry gelling agent. As gelforming agents can be used for example acacia, agar, alginic acid, sodium carboxymethyl cellulose, hydroxypropyl cellulose, hydroxypropyl methylcellulose or other similar cellulose derivatives, fucoidan, xanthan gum, furcellaran, laminaran or similar gelforming agents.

10

In a preferred embodiment of the invention the proton pump inhibitor is omeprazole.

15

The amount of the different components of the composition can vary and will depend on various factors such as for example the individual requirement of the animal treated.

20

The amount of gelforming agent can vary but is within the range 0.02-20% by weight calculated on the amount of wet gel, preferably in the range of 0.2-20% and especially 0.5-5% by weight.

25

The amount of active substance, i.e. the enteric-coated particles, depends on the individual dosages for the animal. For example the amount of enteric-coated particles is usually in the range of 0.1-20 grams, preferably 0.2-10 grams per dosage for horses. The total volume of the final gel given to horses is in the range of 5-50 ml.

30

Other suitable substances which may be incorporated in the composition are flavouring substances known in the pharmaceutical field.

The suitable substances may be added to the enteric-coated proton pump inhibitor particles by mixing the different substances with the enteric-coated particles to a mixture or an ordered mixture. An ordered mixture may be produced for example by particle adhesion or coating processes.

5

The mixtures of enteric-coated proton pump inhibitor particles and the suitable constituents are dried before or after mixing to a moisture level where the proton pump inhibitor has a good long-term stability. The mixture is preferably dispensed into a tight applicator preferably in the form of a syringe.

10

The mixture of the enteric-coated proton pump inhibitor beads or tablets and other constituents can also comprise a suitable pH-buffering substance which will improve the functional stability of the formulation during its transport through the oesophagus and stomach before it reaches the small intestine where the proton pump inhibitor is dissolved and absorbed. Suitable buffering substances are citric acid, tartaric acid, succinic acid, malic acid, lactic acid, benzoic acid, sorbic acid and ascorbic acid and other substances. Such substances will decrease the pH-value of the gel produced to a value below 5.5, thus protecting the enteric coating of the beads or tablets.

15

20

Further the mixture of the enteric coated proton pump inhibitor particles and suitable constituents may also comprise inert particles, such as inert beads to facilitate the mixing of the different constituents with the enteric-coated particles. Such inert beads are for example beads of coated sugar or any other kind of beads not harmful to the animal.

25

Enteric coated beads or tablets can be prepared by conventional methods. Enteric-coated pellets of omeprazole can for instance be prepared as described in the US Patent No. 4,786,505 (=EP 247983) hereby incorporated by reference in its entirety. Such enteric coated pellets or beads of omeprazole are preferably coated with at least two coatings one of which is an isolation coating/subcoat and the other is an enteric coating.

30

The preparation of a stable pharmaceutical composition according to the invention is performed by incorporating a proton pump inhibitor in the form of beads or tablets, which are coated with one or more coatings one of which is an enteric-coating, into a paste-like gel.

5

More particular, the preparation of a formulation in the form of a paste-like gel is performed by either I) mixing the coated particles of the proton pump inhibitor with a dry gelling agent and optionally a pH-buffering system protecting the coated particles whereafter water is added ex tempore, just prior to administration to the animal, or II) mixing the coated particles with a potassium or calcium ion containing salt and optionally a pH-buffering system and thereafter ex tempore, just prior to administration to the animal, with a low-viscous water solution of a gelling agent such as a polymer compound or compounds or by III) mixing the coated particles ex tempore, just prior to administration to the animal, with a low-viscous solution of a gelling agent in the form of temperature-sensitive polymer and optionally with a pH-buffering system and then subjecting the mixture to gentle heating.

**CLAIMS**

1. A pharmaceutical composition for oral administration to animals comprising a proton pump inhibitor in the form of beads or tablets, which are coated with one or more coatings one of which is an enteric-coating, incorporated into a paste-like gel.
2. A pharmaceutical composition according to claim 1, wherein the beads or tablets are coated with at least two coatings one of which is a subcoat and the other is an enteric coating.
3. A pharmaceutical composition according to any of claims 1-2, wherein the pharmaceutical composition is intended for oral administration to horses.
4. A pharmaceutical composition according to any of claims 1-2, comprising components which are dry enteric-coated beads or tablets of a proton pump inhibitor, optionally mixed with dry constituents, which components on addition of water or a water solution gives a paste-like gel.
5. A pharmaceutical composition according to any of claims 1-2, comprising components which are dry enteric-coated beads or tablets of a proton pump inhibitor, dry gelling agent(s) and optionally pH-buffering and/or flavouring substances which components by the addition of water gives a paste-like gel.
6. A pharmaceutical composition according to any of claims 1-2, wherein dry enteric-coated beads or tablets of a proton pump inhibitor, dry gelling agent(s) and optionally pH-buffering and/or flavouring substances are mixed to a dry mixture before the addition of water of a water solution.
7. A pharmaceutical composition according to claim 6, wherein the mixture is an ordered mixture.

This Sheet Has Been Replaced

THIS SHEET HAS BEEN

8. A pharmaceutical composition according to any of claims 1-2, comprising a first group of components which is dry enteric-coated beads or tablets of a proton pump inhibitor, a water soluble, organic or inorganic salt of potassium, calcium, magnesium or aluminium and optionally pH-buffering and/or flavouring substances, and a second group of components which is a water solution of a gelling agent, which groups of components when mixed give a paste-like gel.
9. A pharmaceutical composition according to any of claims 1-2, comprising a first group of components which is dry enteric-coated beads or tablets of a proton pump inhibitor, optionally mixed with dry pH-buffering and/or flavouring substances, and a second group of components which is a water solution of a temperature sensitive gelling agent, which groups of components when mixed and subjected to gentle heating give a paste-like gel.
10. A pharmaceutical composition according to claim 1, wherein the proton pump inhibitor is omeprazole.
11. A pharmaceutical composition according to claim 1, wherein the proton pump inhibitor is lansoprazole.
12. A pharmaceutical composition according to claim 1, wherein the proton pump inhibitor is pantoprazole.
13. A pharmaceutical composition according to claim 1, wherein the proton pump inhibitor is leminoprazole.
14. A stable pharmaceutical composition in the form of a kit comprising dry enteric coated beads or tablets of a proton pump inhibitor and dry constituents, which components on addition of water or a water solution give a paste-like gel.
15. A stable pharmaceutical composition in the form of a kit comprising a first group of components which is dry enteric-coated beads or tablets of a proton

wherein R^8 is lower alkyl or lower alkoxy.

Lower alkyl in the present invention means an alkyl group having 1-5 carbon atoms.

Lower alkoxy in the present invention means an alkoxy group having 1-5 carbon atoms.

05 NOV 1996

5

Examples of proton pump inhibitors according to formula I are

Omeprazole

Lanzoprazole

Pantoprazole

E — 3810

05 NOV 1996

Leminoprazole

S— 4216

The proton pump inhibitors used in the compositions of the invention may be used in neutral form or in the form of a basic salt, such as for instance the Mg^{2+} , Ca^{2+} , Na^+ , or K^+ salts, preferably the Mg^{2+} or Na^+ salts. Further where applicable, a compound listed above may be used in racemic form or in the form of a substantially pure enantiomer.

In one embodiment of the invention the enteric-coated particles are mixed with suitable substances, such as for instance suitable inorganic or organic water soluble salts of potassium, calcium, magnesium or aluminium. When a water solution of a suitable polymeric compound or compounds, such as for instance kappa-carrageenan, pectin, anionic polymers known to give gels with positively charged metal ions, or similar compounds, is added to the mixture a paste-like gel is formed through the interaction of the ions with the polymers.

In another embodiment of the invention the enteric-coated particles are mixed with

05 NOV 1996

suitable constituents. When a low-viscous solution of a temperature-sensitive polymer, such as for instance ethylhydroxyethylcellulose (EHEC) or polyethylenepolypropylene glycols or similar substances, is added and the system is warmed to temperatures of 33-35°C or higher a viscous paste-like gel is formed.

In still another embodiment of the invention the enteric-coated particles are mixed with suitable substances in the form of gelforming agents, such as dry gelling agent. As gelforming agents can be used for example acacia, agar, alginic acid, sodium carboxymethyl cellulose, hydroxypropyl cellulose, hydroxypropyl methylcellulose or other similar cellulose derivatives, fucoidan, xanthan gum, furcellaran, laminaran or similar gelforming agents.

In a preferred embodiment of the invention the proton pump inhibitor is omeprazole.

The amount of the different components of the composition can vary and will depend on various factors such as for example the individual requirement of the animal treated.

The amount of gelforming agent can vary but is within the range 0.02-20% by weight calculated on the amount of wet gel, preferably in the range of 0.2-20% and especially 0.5-5% by weight.

The amount of active substance, i.e. the enteric-coated particles, depends on the individual dosages for the animal. For example the amount of enteric-coated particles is usually in the range of 0.1-20 grams, preferably 0.2-10 grams per dosage for horses. The total volume of the final gel given to horses is in the range of 5-50 ml.

Other suitable substances which may be incorporated in the composition are flavouring substances known in the pharmaceutical field.

05 NOV 1996

The suitable substances may be added to the enteric-coated proton pump inhibitor particles by mixing the different substances with the enteric-coated particles to a mixture or an ordered mixture. An ordered mixture may be produced for example by particle adhesion or coating processes.

The mixtures of enteric-coated proton pump inhibitor particles and the suitable constituents are dried before or after mixing to a moisture level where the proton pump inhibitor has a good long-term stability. The mixture is preferably dispensed into a tight applicator preferably in the form of a syringe.

The mixture of the enteric-coated proton pump inhibitor beads or tablets and other constituents can also comprise a suitable pH-buffering substance which will improve the functional stability of the formulation during its transport through the oesophagus and stomach before it reaches the small intestine where the proton pump inhibitor is dissolved and absorbed. Suitable buffering substances are citric acid, tartaric acid, succinic acid, malic acid, lactic acid, benzoic acid, sorbic acid and ascorbic acid and other substances. Such substances will decrease the pH-value of the gel produced to a value below 5.5, thus protecting the enteric coating of the beads or tablets.

Further the mixture of the enteric coated proton pump inhibitor particles and suitable constituents may also comprise inert particles, such as inert beads to facilitate the mixing of the different constituents with the enteric-coated particles. Such inert beads are for example beads of coated sugar or any other kind of beads not harmful to the animal.

Enteric coated beads or tablets can be prepared by conventional methods. Enteric-coated pellets of omeprazole can for instance be prepared as described in the US Patent No. 4,786,505 (=EP 247983) hereby incorporated by reference in its entirety. Such enteric coated pellets or beads of omeprazole are preferably coated with at least two coatings one of which is an isolation coating/subcoat and the other is an enteric coating.

05 NOV 1996

The preparation of a stable pharmaceutical composition according to the invention is performed by incorporating a proton pump inhibitor in the form of beads or tablets, which are coated with one or more coatings one of which is an enteric-coating, into a paste-like gel.

More particular, the preparation of a formulation in the form of a paste-like gel is performed by either I) mixing the coated particles of the proton pump inhibitor with a dry gelling agent and optionally a pH-buffering system protecting the coated particles whereafter water is added ex tempore, just prior to administration to the animal, or II) mixing the coated particles with a potassium or calcium ion containing salt and optionally a pH-buffering system and thereafter ex tempore, just prior to administration to the animal, with a low-viscous water solution of a gelling agent such as a polymer compound or compounds or by III) mixing the coated particles ex tempore, just prior to administration to the animal, with a low-viscous solution of a gelling agent in the form of temperature-sensitive polymer and optionally with a pH-buffering system and then subjecting the mixture to gentle heating.

Examples

The omeprazole enteric-coated pellets in the examples below are prepared according to example 2 of US-A 4,786,505 (=EP 247983) hereby incorporated by reference in its entirety.

Example 1

Omeprazole enteric-coated pellets	7 g
(corresponding to about 600 mg of omeprazole)	
Xanthan gum	0.3 g

are mixed in a syringe.

When 10 ml of water are added a viscous gel is formed.

05 NOV 1996

CLAIMS

1. A pharmaceutical composition for oral administration to animals comprising a proton pump inhibitor in the form of beads or tablets, which are coated with one or more coatings one of which is an enteric-coating, incorporated into a paste-like gel.
2. A pharmaceutical composition according to claim 1, wherein the beads or tablets are coated with at least two coatings one of which is a subcoat and the other is an enteric coating.
3. A pharmaceutical composition according to any of claims 1-2, wherein the pharmaceutical composition is intended for oral administration to horses.
4. A pharmaceutical composition according to any of claims 1-2, comprising components which are dry enteric-coated beads or tablets of a proton pump inhibitor, optionally mixed with dry constituents, which components on addition of water or a water solution gives a paste-like gel.
5. A pharmaceutical composition according to any of claims 1-2, comprising components which are dry enteric-coated beads or tablets of a proton pump inhibitor, dry gelling agent(s) and optionally pH-buffering and/or flavouring substances which components by the addition of water gives a paste-like gel.
6. A pharmaceutical composition according to any of claims 1-2, wherein dry enteric-coated beads or tablets of a proton pump inhibitor, dry gelling agent(s) and optionally pH-buffering and/or flavouring substances are mixed to a dry mixture before the addition of water of a water solution.
7. A pharmaceutical composition according to claim 6, wherein the mixture is an ordered mixture.

8. A pharmaceutical composition according to any of claims 1-2, comprising a first group of components which is dry enteric-coated beads or tablets of a proton pump inhibitor, a water soluble, organic or inorganic salt of potassium, calcium, magnesium or aluminium and optionally pH-buffering and/or flavouring substances, and a second group of components which is a water solution of a gelling agent, which groups of components when mixed give a paste-like gel.

9. A pharmaceutical composition according to any of claims 1-2, comprising a first group of components which is dry enteric-coated beads or tablets of a proton pump inhibitor, optionally mixed with dry pH-buffering and/or flavouring substances, and a second group of components which is a water solution of a temperature sensitive gelling agent, which groups of components when mixed and subjected to gentle heating give a paste-like gel.

10. A pharmaceutical composition according to claim 1, wherein the proton pump inhibitor is omeprazole.

11. A pharmaceutical composition according to claim 1, wherein the proton pump inhibitor is lansoprazole.

12. A pharmaceutical composition according to claim 1, wherein the proton pump inhibitor is pantoprazole.

13. A pharmaceutical composition according to claim 1, wherein the proton pump inhibitor is leminoprazole.

14. A stable pharmaceutical composition in the form of a kit comprising dry enteric coated beads or tablets of a proton pump inhibitor and dry constituents, which components on addition of water or a water solution give a paste-like gel.

15. A stable pharmaceutical composition in the form of a kit comprising a first group of components which is dry enteric-coated beads or tablets of a proton

pump inhibitor, a water soluble, organic or inorganic salt of potassium, calcium, magnesium or aluminium and optionally pH-buffering and/or flavouring substances, and a second group of components which is dry gelling agent(s), which groups of components when mixed in the presence of water give a paste-like gel.

16. A stable pharmaceutical composition in the form of a kit comprising a first group of components which is dry enteric-coated beads or tablets of a proton pump inhibitor, optionally mixed with dry pH-buffering and/or flavouring substances, and a second group of components which are temperature sensitive gelling agent(s), which groups of components when mixed in the presence of water and subjected to gentle heating give a paste-like gel.

17. A pharmaceutical composition according to any of the claims 1, 15 or 16 characterized in that the composition in its entirety or parts thereof is dispensed into an applicator in the form of a syringe.

18. A process for the preparation of a pharmaceutical composition according to claim 1, characterized by incorporating a proton pump inhibitor in the form of beads which are coated with one or more coatings one of which is an enteric-coating into a paste-like gel.

19. Use of a composition according to any of claims 1, 15 or 16 in the preparation of an active dosage form for the treatment of gastric acid related diseases in animals.

20. Method for treatment of gastric acid related diseases wherein a physiologically active amount of a composition according to claims 1, 15 or 16 is administered to an animal in the need of such treatment.

VETERINARY COMPOSITION**ABSTRACT**

A stable, oral pharmaceutical composition comprising a proton pump inhibitor and a gelling agent designed for the treatment of gastric acid related diseases in animals, the process for preparation of the composition and the use thereof.

CLAIMS

1. A pharmaceutical composition for oral administration to animals characterized in that it comprises a proton pump inhibitor in the form of beads or tablets, which are coated with one or more coatings one of which is an enteric-coating, characterized in that the proton pump inhibitor in the form of beads or tablets is incorporated into a paste-like gel.
2. A pharmaceutical composition according to claim 1, characterized in that the beads or tablets are coated with at least two coatings one of which is a subcoat and the other is an enteric coating.
3. A pharmaceutical composition according to any of claims 1-2, characterized in that the pharmaceutical composition is intended for oral administration to horses.
4. A pharmaceutical composition according to any of claims 1-2, characterized in that the composition comprises components which are dry enteric-coated beads or tablets of a proton pump inhibitor, optionally mixed with dry constituents, which components on addition of water or a water solution gives a paste-like gel.
5. A pharmaceutical composition according to any of claims 1-2 characterized in that it comprises components which are dry enteric-coated beads or tablets of a proton pump inhibitor, dry gelling agent(s) and optionally pH-buffering and/or flavouring substances which components by the addition of water gives a paste-like gel.
6. A pharmaceutical composition according to any of claims 1-2 characterized in that the dry enteric-coated beads or tablets of a proton pump inhibitor, dry gelling agent(s) and optionally pH-buffering and/or flavouring substances are mixed to a dry mixture before the addition of water or a water solution.

7. A pharmaceutical composition according to claim 6 characterized in that the mixture is an ordered mixture.
8. A pharmaceutical composition according to any of claims 1-2 characterized in that it comprises a first group of components which is dry enteric-coated beads or tablets of a proton pump inhibitor, a water soluble, organic or inorganic salt of potassium, calcium, magnesium or aluminium and optionally pH-buffering and/or flavouring substances, and a second group of components which is a water solution of a gelling agent, which groups of components when mixed give a paste-like gel.
9. A pharmaceutical composition according to any of claims 1-2 characterized in that it comprises a first group of components which is dry enteric-coated beads or tablets of a proton pump inhibitor, optionally mixed with dry pH-buffering and/or flavouring substances, and a second group of components which is a water solution of a temperature sensitive gelling agent, which groups of components when mixed and subjected to gentle heating give a paste-like gel.
10. A pharmaceutical composition according to claim 1 characterized in that the proton pump inhibitor is omeprazole.
11. A pharmaceutical composition according to claim 1 characterized in that the proton pump inhibitor is lansoprazole.
12. A pharmaceutical composition according to claim 1 characterized in that the proton pump inhibitor is pantoprazole.
13. A pharmaceutical composition according to claim 1 characterized in that the proton pump inhibitor is leminoprazole.
14. A stable pharmaceutical composition for oral administration to animals in the form of a kit comprising dry enteric coated beads or tablets of a proton pump inhibitor and dry constituents, which components on addition of water or a water solution give a paste-like gel.
