A event detecting apparatus 2000 acquires one or more video data 10, and generates, from the one or more video data 10, object relationship information 40 that indicates two or more action-related relationships between objects. The event detecting apparatus 2000 acquires an event information 50 that indicates an event of interest by a sequence of action-related situations at least one of which represents a situation in which a specific action is taken by a specific subject. The event detecting apparatus 2000 determines whether or not the event of interest occurs based on the object relationship information 40 and the event information 50.
