

Abstract

Perfume Bottle Pendant

5 The utility model discloses a perfume bottle pendant, comprising a bottle body for containing perfume essential oil, a decorative housing sleeved on the periphery of the bottle body, a bottle cap arranged over the bottle body, a screw position arranged below the bottle cap, with one end extending into the inside of the bottle body, and a decorative cap head arranged above the bottle cap, wherein the bottle body and bottle
10 cap are made from an aluminum alloy material, and a buckling portion for buckling a chain connecting device is arranged on a joint of the bottle cap and the bottle body. The container of the present utility model has a small size to match with the light design of gemstones or semi-gemstones, so that the whole pendant has a lower weight and is suitable for being hung on necks. The material of the container is changed from
15 glass to aluminum alloy since the aluminum alloy is stainless and free from oxidization, which is suitable for injecting and storing essential oil. Since the inner-container is changed to be smaller in size, the screw position is lengthened to increase capacity, in place of using a previous glass water dip rod, which also solves the problem of being difficult to remove the cap after wrenching the cap. A metal
20 switch buckle and a chain are added on the bottleneck of the pendant to make the pendant a functional product.
