

INFORMATION SHARING METHODS, APPARATUSES, AND DEVICES

ABSTRACT

Embodiments of the present specification disclose an information sharing method,
5 apparatus, and device. The solution can include: After obtaining a user verification
result acquisition request sent by a first institution, a privacy computing unit can
determine a verification result of a user requested by the user verification result
acquisition request, and feed back the verification result of the user to the first
institution. The verification result of the user is obtained by performing matching
10 verification on first data and second data of the user; the first data is user basic data
obtained by decrypting first encrypted data of the user that is sent by a second institution;
the second data is user basic data obtained by decrypting second encrypted data of the
user that is sent by a third institution; and the third institution is a trustworthy institution.
