

SYSTEMS AND METHODS FOR E-COMMERCE CHECKOUT WITH DELAY LOADING OF CHECKOUT OPTIONS

ABSTRACT

5 Systems and methods for progressively providing checkout options during a checkout transaction are provided. During a transaction process, a user interface with an options category having a set of checkout options is provided. Requests associated with the checkout options are transmitted, with at least one of the
10 transmitted queries being transmitted to a remote third-party. One or more of the checkout options are identified as a first set of options and others are identified as a second set of options. The user interface is updated to display the first set of options and a selectable UI element prior to display of the second set of options, where all of the second set of options are hidden from display prior to selection of
15 the selectable UI element. The checkout transaction is completable using one of the options from the first set of options without display of the second set of options.
