

OFFLINE TRANSACTION PROCESSING

ABSTRACT

Embodiments of this specification disclose an offline transaction processing method, apparatus, and device. The method is applied to a first terminal of a transaction initiator. The method includes the following: Information about a current network connection status of the first terminal is obtained for a target transaction; if the current network connection status of the first terminal is connected, and it is determined that a network connection status of a second terminal of a transaction target party of the target transaction is unconnected, or the current network connection status of the first terminal is unconnected, it is determined whether the first terminal can output a transaction identification code used to trigger offline transaction processing on the target transaction; and an offline transaction policy corresponding to a determining result is selected based on the determining result indicating whether the first terminal can output the transaction identification code, and offline transaction processing is performed on the target transaction between the second terminal based on the selected offline transaction policy.
