

TITLE

ORDER PROCESSING METHOD, SYSTEM, AND STORAGE MEDIUM

ABSTRACT

This specification provides an order processing method, a system, and a storage medium. The method includes: A front-end device obtains payment information of a payer about a target transaction, and sends a first payment instruction to a remote server based on the payment information. The server receives the first payment instruction; generates a second payment instruction for a target order based on the first payment instruction, and sends the second payment instruction to an acquiring institution, where the target order corresponds to the target transaction; receives a payment result sent by the acquiring institution for the target order; and sends content data of a two-dimensional code corresponding to the target order to the front-end device based on the payment result. The front-end device receives the content data, where the target order corresponds to the target transaction; and generates the target order locally based on the content data and a code rule.
