

Description

The present invention relates to a package assembly for providing ultra-clean storage and gravity discharge of contaminable powder or granular materials.

In another aspect the present invention relates to a sterile vapor impermeable bag which Provides contamination free storage and gravity discharge of contaminable powder or granular material stored therein.

Many products, such as powder or granular materials are shipped and stored in large bulk bags which can accommodate a heavy load in the order of thousands of pounds of materials.

For many operations the nature of the materials and their intended end uses make it imperative that these materials be "loaded" into these bags in a contamination free environment due to the fact that contaminants would negatively alter the desirable physical and chemical properties of the materials.

Thus materials such as powdery or granular resins which are used in the power cable industry are presently being loaded into bags in an ultra clean environment in order to provide the cleanliness needed for its insulating properties. As a matter of fact modern and sophisticated manufacturing of power cable resins is now accomplished in a closed system which greatly reduces contaminant levels over previous methods. However, in order to deliver this improved level of cleanliness to customers, it is necessary to extend the ultra-clean environment from the manufacturer to the extruder hopper of the converting operation. This can be accomplished by means of a manufacturer to converter sealed system. Unfortunately, however, until the present invention, no completely satisfactory system existed and product has been contaminated during storage and discharge resulting in unacceptable changes in the physical and chemical properties of the resins.

DE-C-35 39 619 discloses a package assembly for granular material of high purity which is composed of a shrink film surrounding a paperboard box which contains an outer film bag surrounding a bag-like woven container having a polyethylene inner coating and being provided with an inner liner made of an aluminum film having an outer coating (adjacent to the polyethylene inner coating of the bag-like container) and an inner coating of polyethylene (in contact with the material to be accommodated). Both bag-like container and said inner liner are provided with flexible hoses at their respective openings for filling and discharging.

The present invention provides a package assembly for ultra-clean storage and gravity discharge of contaminable powder or granular materials which comprises (i) an outer container ac-

comodating (ii) a sterile vapor impermeable bag having a bag body and an inlet and an outlet, said inlet and outlet being closed when said bag accommodates said material to prevent contamination of said material and said outlet defining an opening, (iii) a woven outer liner completely surrounding and enclosing said bag and (iv) a vapor impermeable outer sheet covering enclosing said bag and said woven outer liner, which package assembly also comprises (v) a flexible vapor impermeable tubular inner sheet extending from said opening and having a discharge end, and (vi) a tubular outer sheet enveloping said inner sheet the upper end of said inner sheet being sealed to the bag in a manner such as to impart a closed configuration to said inner sheet, the tubular outer sheet being vapour impermeable and terminating in a closed end, the upper end of said outer sheet being sealed to the inner sheet proximate the opening or to the lower portion of the bag body; said inner sheet being secured by releasable securing means proximate said opening to prevent discharge of materials from said opening whereby when said inner sheet is positioned in a receiving means and said terminal end of said outer sheet is open and positioned around said receiving means and secured thereto, release of said securing means permits discharge of said material into said receiving means without contamination of said material.

The present invention also provides said impermeable bag provided with said inner and said outer sheet.

The woven outer liner completely surrounding and enclosing the bag provides strength and increased portability to the bag.

The vapor impermeable sheet covering forming an outer cover lining further protects the material in the bag from contamination.

In the drawings:

FIG. 1 is a front view of a bag showing the outlet with inner and outer sheets being extended away from the bottom of the bag.

FIG. 2 is a view of the bottom of the outer liner and being provided with movable closure petals forming a part of the woven outer liner.

FIG. 3 is a view of the bottom portion of the bag in position over a material receiving means with the inner sheet inside the receiving means and the outer sheet in place around the receiving means.

FIG. 4 is an exploded view with parts broken away and showing the composite assembly of the bag, woven outer liner, outer sheet covering and container.

Referring particularly to FIG. 1 there is illustrated a bag generally depicted by reference numeral 2 which can be fabricated from a material which is vapor impermeable and formed from a

resin such as from high-pressure low density polyethylene, ethylene-vinyl acetate copolymers, medium or high density polyethylene, polypropylene, polybutene-1 and like thermoplastic flexible materials. The film from which the bag is fabricated is of sufficient thickness to prevent cracking or breaking depending on the materials contained therein. The bag is, if required, subjected to a sterilization treatment to remove or destroy undesired contaminants. The bag is provided with an inlet 4 at its top end which can be sealed to close the inlet or which can be opened or closed by tie string 6, and the bag is further provided with outlet 8 at its bottom end.

As best seen in FIG. 3, outlet 8 defines an opening 10 and includes a flexible vapor impermeable tubular inner sheet 12 extending from opening 10 the upper end 14 of which is sealed to bag 2 in a manner such as to impart a closed configuration, preferably a tubular or circular configuration to inner sheet 12. Inner sheet 12 is adapted to be crumpled or furled due to its flexibility into opening 10 and can be constructed of the same material forming the bag body. Inner sheet 12 is also capable of being extended away from opening 10 to expose a discharge end 16 of inner sheet 12.

A vapor impermeable flexible outer sheet 18 is also provided which surrounds and envelopes inner sheet 12. Outer sheet 18 can also be fabricated from the same type of material as the bag body and the upper end 20 can be sealed to the inner sheet 12 proximate opening 10 as shown in the drawing or to the lower portion of the bag body. Outer sheet 18 is also adapted to be crumpled or furled into opening 10 and when extended and drawn from opening 10, the terminal sealed end 22 (as shown in FIG. 1) when opened preferably extends beyond discharge end 16 of inner sheet 12.

The bag can be utilized in combination with a receiving means which has a receiving inlet for loading discharged material into a hopper or like container and which can provide a contamination free loading. The inlet must provide access to inner sheet 12 from the interior of the receiving inlet prior to loading. An example of a receiving inlet is illustrated in FIG. 3 by reference numeral 24. The receiving inlet can be of rectangular or circular configuration preferably of the same configuration as outer sheet 18 and is constructed of materials which provide strength and rigidity to be able to support loading and unloading of material and to provide a proper base for securing outer sheet 18 to its periphery.

Receiving inlet 24 is provided with an opening 26 of sufficient dimension to permit an operator to insert a hand through to gain access to the interior 28 of receiving inlet 24.

Prior to unloading the contents of bag 2 into receiving inlet 24, inner sheet 12 and outer sheet 18 are furled into opening 10 of bag 2.

The bag 2 can be shipped with the present packaging assembly containing the outer coverings as shown in FIG. 4. Thus referring to FIG. 4, bag 2 is enclosed in a woven outer liner depicted by reference numeral 30.

The outer liner can be formed from a woven fabric such as burlap, canvas, polypropylene, etc. The outer liner 30 can be rectangular in cross section and can be fabricated by techniques well known in the art. The bottom portion of the outer liner is provided with closure petals, 32 (as shown in FIG. 2) which when opened provide an opening substantially corresponding to opening 10 of bag 2.

Petals 32 can be triangular in cross section and when parallel to the bottom plane of the outer liner, they prevent the furled inner sheet 12 and outer sheet 18 from being dislodged from the bottom opening 10 of bag 2. Petals 32 are sufficiently flexible however so that when they are bent away from the bottom of the outer liner, they provide access to the inner sheet 12 and outer sheet 18 for extending the sheets in a direction away from opening 10.

To further insure against contamination of material during storage and shipment, the components, bag 2 and woven outer liner 30 are completely enclosed in an outer sheet covering 34 which completely surrounds and contains woven outer liner 30 and bag 2. Outer sheet covering 34 is fabricated from a vapor impermeable material which can be similar to the materials forming bag 2.

The entire composite i.e., bag 2, woven outer liner in closure 30 and outer sheet covering 34 are contained in container 36 having a body portion 38, a bottom base plate 40, and a top cover 42. The container 36 is fabricated from heavy corrugated paperboard and the preferred container is of the type disclosed in US-A-4,296,860.

The entire assembly can be transported and stored on pallet 44 until required for use.

In a typical mode of operation and use, the assembly arrives at the point of use with the entire contents of the stored material free from contamination. This is possible due to the material loading conditions and the sterilization of bag 2. At the point of use, outer sheet covering 34, woven outer liner 30, and bag 2 are separated from container 36. Outer sheet covering 34 can also be removed from woven outer liner 30 and bag 2. The remaining assembly can then be positioned over receiving inlet 24 leading to a sealed hopper for subsequent processing. Closure petals 32 are bent outward away from the bottom of woven outer liner 30 to provide access to furled inner sheet 12 and outer

sheet 18. The operator then cuts terminal sealed end 22 of outer sheet 18 and places the end around the upper portion of receiving inlet 24, while leaving tie string 46 in its tightened position. The operator then inserts a hand through opening 26 and pulls down inner sheet 12 below opening 26 and into the interior of receiving inlet 24.

The operator then withdraws the hand and pulls outer sheet 18 downward around the periphery of receiving inlet 24 so that the severed end of the outer sheet 18 extends below opening 26. The bottom portion of outer sheet 18 is then secured around the periphery by an outer sheet closure means such as shock cord 48. After securing outer sheet 18, tie string 46 is loosened thereby permitting discharge of the contents of bag 2 into receiving inlet 24, such discharge being accomplished without exposing the contents to the contaminating materials which may be present in the atmosphere.

Claims

1. A package assembly for providing ultra-clean storage and gravity discharge of contaminable powder or granular materials which comprises (i) an outer container (36) accommodating (ii) a sterile vapor impermeable bag (2) having a bag body and an inlet (4) and an outlet (8), said inlet (4) and outlet (8) being closed when said bag (2) accommodates said material to prevent contamination of said material and said outlet (8) defining an opening (10), (iii) a woven outer liner (30) completely surrounding and enclosing said bag (2) and (iv) a vapor impermeable outer sheet covering (34) enclosing said bag (2) and said woven outer liner (30), said package assembly also comprising (v) a flexible vapor impermeable tubular inner sheet (12) extending from said opening (10) and having a discharge end (16), and (vi) a tubular outer sheet (18) enveloping said inner sheet (12), characterized in that the upper end (14) of said inner sheet (12) is sealed to the bag (2) in a manner such as to impart a closed configuration to said inner sheet (12), that the tubular outer sheet (18) is vapour impermeable and terminates in a closed end (22), that the upper end (20) of said outer sheet (18) is sealed to the inner sheet (12) proximate the opening (10) or to the lower portion of the bag body; and that said inner sheet (12) is secured by releasable securing means (46) proximate said opening (10) to prevent discharge of materials from said opening (10) whereby when said inner sheet (12) is positioned in a receiving means and said terminal end (22) of said outer sheet (18) is open and positioned around said receiving means and secured thereto, release of said securing means permits discharge of said material into said receiving means without contamination of said material.
2. A package assembly according to claim 1 wherein said bag (2) is fabricated from high pressure low density polyethylene, or ethylene vinyl acetate copolymers, or medium or high density polyethylene, or polypropylene, or polybutene-1 or mixtures thereof.
3. A package assembly according to any one of claims 1-2 wherein said releasable securing means (46) is a tie string.
4. A package assembly according to any one of claims 1-3 wherein the closure means for providing the closed end (22) of outer sheet (18) is a shock cord.
5. A package assembly according to any one of claims 1-4 wherein said inner sheet (12) and outer sheet (18) are furled into said opening (10) during shipment and storage.
6. A package assembly according to any one of claims 1-5 wherein said woven outer liner (30) includes a bottom portion having closure petals (32) defining an access opening, said closure petals (32) being bent away from said bottom portion to provide an access opening substantially corresponding to said opening (10).
7. A package assembly according to claim 6 wherein said inner sheet (12) and outer sheet (18) are furled into said access opening during shipment and storage of said package assembly.
8. A vapor impermeable bag (2) for providing ultra-clean storage and gravity discharge of contaminable powder or granular materials which comprises a bag body, an inlet (4) and an outlet (8), said inlet and outlet being closed when said bag accommodates said material to prevent contamination of said material and said outlet (8) defining an opening (10), and said bag being provided with (a) a flexible vapor impermeable tubular inner sheet (12) extending from said opening (10) and having a discharge end (16), and (b) a tubular outer sheet (18) enveloping said inner sheet (12), characterized in that the upper end (14) of said inner sheet (12) is sealed to the bag (2) in a manner such as to impart a closed configuration to said inner sheet (12), that the tubular outer sheet (18) is vapour impermeable and terminates in a closed end (22), that the upper

sheet 18. The operator then cuts terminal sealed end 22 of outer sheet 18 and places the end around the upper portion of receiving inlet 24, while leaving tie string 46 in its tightened position. The operator then inserts a hand through opening 26 and pulls down inner sheet 12 below opening 26 and into the interior of receiving inlet 24.

The operator then withdraws the hand and pulls outer sheet 18 downward around the periphery of receiving inlet 24 so that the severed end of the outer sheet 18 extends below opening 26. The bottom portion of outer sheet 18 is then secured around the periphery by an outer sheet closure means such as shock cord 48. After securing outer sheet 18, tie string 46 is loosened thereby permitting discharge of the contents of bag 2 into receiving inlet 24, such discharge being accomplished without exposing the contents to the contaminating materials which may be present in the atmosphere.

Claims

1. A package assembly for providing ultra-clean storage and gravity discharge of contaminable powder or granular materials which comprises (i) an outer container (36) accommodating (ii) a sterile vapor impermeable bag (2) having a bag body and an inlet (4) and an outlet (8), said inlet (4) and outlet (8) being closed when said bag (2) accommodates said material to prevent contamination of said material and said outlet (8) defining an opening (10), (iii) a woven outer liner (30) completely surrounding and enclosing said bag (2) and (iv) a vapor impermeable outer sheet covering (34) enclosing said bag (2) and said woven outer liner (30), said package assembly also comprising (v) a flexible vapor impermeable tubular inner sheet (12) extending from said opening (10) and having a discharge end (16), and (vi) a tubular outer sheet (18) enveloping said inner sheet (12), characterized in that the upper end (14) of said inner sheet (12) is sealed to the bag (2) in a manner such as to impart a closed configuration to said inner sheet (12), that the tubular outer sheet (18) is vapour impermeable and terminates in a closed end (22), that the upper end (20) of said outer sheet (18) is sealed to the inner sheet (12) proximate the opening (10) or to the lower portion of the bag body; and that said inner sheet (12) is secured by releasable securing means (46) proximate said opening (10) to prevent discharge of materials from said opening (10) whereby when said inner sheet (12) is positioned in a receiving means and said terminal end (22) of said outer sheet (18) is open and positioned around said receiving means and secured thereto, re-

lease of said securing means permits discharge of said material into said receiving means without contamination of said material.

2. A package assembly according to claim 1 wherein said bag (2) is fabricated from high pressure low density polyethylene, or ethylene vinyl acetate copolymers, or medium or high density polyethylene, or polypropylene, or polybutene-1 or mixtures thereof.
3. A package assembly according to any one of claims 1-2 wherein said releasable securing means (46) is a tie string.
4. A package assembly according to any one of claims 1-3 wherein the closure means for providing the closed end (22) of outer sheet (18) is a shock cord.
5. A package assembly according to any one of claims 1-4 wherein said inner sheet (12) and outer sheet (18) are furled into said opening (10) during shipment and storage.
6. A package assembly according to any one of claims 1-5 wherein said woven outer liner (30) includes a bottom portion having closure petals (32) defining an access opening, said closure petals (32) being bent away from said bottom portion to provide an access opening substantially corresponding to said opening (10).
7. A package assembly according to claim 6 wherein said inner sheet (12) and outer sheet (18) are furled into said access opening during shipment and storage of said package assembly.
8. A vapor impermeable bag (2) for providing ultra-clean storage and gravity discharge of contaminable powder or granular materials which comprises a bag body, an inlet (4) and an outlet (8), said inlet and outlet being closed when said bag accommodates said material to prevent contamination of said material and said outlet (8) defining an opening (10), and said bag being provided with (a) a flexible vapor impermeable tubular inner sheet (12) extending from said opening (10) and having a discharge end (16), and (b) a tubular outer sheet (18) enveloping said inner sheet (12), characterized in that the upper end (14) of said inner sheet (12) is sealed to the bag (2) in a manner such as to impart a closed configuration to said inner sheet (12), that the tubular outer sheet (18) is vapour impermeable and terminates in a closed end (22), that the upper

end (20) of said outer sheet (18) is sealed to the inner sheet (12) proximate opening (10) or to the lower portion of the bag body; and that said inner sheet (12) is secured by releasable securing means (46) proximate said opening (10) to prevent discharge of materials from said opening (10) whereby when said inner sheet (12) is positioned in a receiving means and said terminal end (22) of said outer sheet (18) is open and positioned around said receiving means and secured thereto, release of said securing means permits discharge of said material into said receiving means without contamination of said material.

9. A bag according to claim 8 wherein said bag (2) is fabricated from high pressure low density polyethylene, or ethylene vinyl acetate copolymers, or medium or high density polyethylene, or polypropylene, or polybutene-1 or mixtures thereof.
10. A bag according to claim 8 or 9 wherein said releasable securing means (46) is a tie string.
11. A bag according to any one of claims 8-10 wherein the closure means for providing the closed end (22) of the outer sheet (18) is a shock cord.
12. A bag according to any one of claims 8-11 wherein said inner sheet (12) and outer sheet (18) are furled into said opening (10) during shipment and storage.

Patentansprüche

1. Verpackungseinheit für die Bereitstellung von ultrasauberer Lagerung und ultrasauberem Austrag durch Schwerkraft von kontaminierbarem Pulver oder granulären Materialien, welche umfaßt (i) einen äußeren Behälter (36), der beherbergt (ii) einen sterilen, Dampf-undurchlässigen Beutel (2) mit einem Beutelkörper und einem Einlaß (4) und einem Auslaß (8), wobei der Einlaß (4) und der Auslaß (8) geschlossen sind, wenn der Beutel (2) das Material enthält, um die Kontaminierung des Materials zu verhindern, und der Auslaß (8) eine Öffnung (10) definiert, (iii) eine gewebte äußere Zwischenlage (30), die den Beutel (2) vollständig umgibt und einschließt, und (iv) eine Dampf-undurchlässige äußere Folien-Umkleidung (34), die den Beutel (2) und die gewebte äußere Zwischenlage (30) umhüllt, wobei die Verpackungseinheit auch umfaßt (v) eine flexible Dampf-undurchlässige röhrenförmige innere Folie (12), die sich von der Öffnung (10) her

erstreckt und ein Austragsende (16) aufweist, und (vi) eine röhrenförmige äußere Folie (18), die die innere Folie (12) umhüllt, dadurch gekennzeichnet, daß das obere Ende (14) der inneren Folie (12) auf solche Weise an den Beutel (2) angesiegelt ist, daß der inneren Folie (12) eine geschlossene Konfiguration verliehen wird, daß die röhrenförmige äußere Folie (18) Dampf-undurchlässig ist und in einem geschlossenen Ende (22) endet, daß das obere Ende (20) der äußeren Folie (18) in der Nähe der Öffnung (10) oder des unteren Teils des Beutelkörpers an die innere Folie (12) angesiegelt ist; und daß die innere Folie (12) durch ein lösbares Sicherungsmittel (46) in der Nähe der Öffnung (10) gesichert ist, um den Austrag von Materialien aus dieser Öffnung (10) zu verhindern, wodurch, wenn die innere Folie (12) in einer Empfangsvorrichtung positioniert ist und das terminale Ende (22) der äußeren Folie (18) offen ist und um die Empfangsvorrichtung herum positioniert und daran sicher befestigt ist, das Lösen des Sicherungsmittels den Austrag des Materials in die Empfangsvorrichtung ohne Kontaminierung des Materials erlaubt.

2. Verpackungseinheit nach Anspruch 1, bei der der Beutel (2) aus Hochdruck-Polyethylen niedriger Dichte oder Ethylen-Vinylacetat-Copolymeren oder Polyethylen mittlerer oder hoher Dichte oder Polypropylen oder Polybuten-1 oder Mischungen davon hergestellt ist.
3. Verpackungseinheit nach irgendeinem der Ansprüche 1 - 2, in welcher das lösbare Sicherungsmittel (46) eine Knoten-Schnur ist.
4. Verpackungseinheit nach irgendeinem der Ansprüche 1 - 3, in welcher das Verschlußmittel zur Bereitstellung des geschlossenen Endes (22) der äußeren Folie (18) eine Stoß-Schnur ist.
5. Verpackungseinheit nach irgendeinem der Ansprüche 1 - 4, in welcher die innere Folie (12) und die äußere Folie (18) während des Transports und der Lagerung in die Öffnung (10) hineingebauscht sind.
6. Verpackungseinheit nach irgendeinem der Ansprüche 1 - 5, in welcher die gewebte äußere Zwischenlage (30) einen Bodenteil mit Verschlußklappen (32) einschließt, die eine Zugangsöffnung definieren, wobei diese Verschlußklappen (32) vom Bodenteil weggebogen sind, um eine Zugangsöffnung, die im wesentlichen der Öffnung (10) entspricht, bereitzustellen.

7. Verpackungseinheit nach Anspruch 6, in welcher die innere Folie (12) und die äußere Folie (18) während des Transports und der Lagerung der Verpackungseinheit in diese Zugangsöffnung hineingebauscht sind.
8. Dampf-undurchlässiger Beutel (2) zur Bereitstellung von ultrasauberer Lagerung und ultrasauberem Austrag durch Schwerkraft von kontaminierbarem Pulver oder granulären Materialien, welcher umfaßt einen Beutelnkörper, einen Einlaß (4) und einen Auslaß (8), wobei der Einlaß und der Auslaß geschlossen sind, wenn der Beutel das Material enthält, um eine Kontaminierung des Materials zu verhindern, und der Auslaß (8) eine Öffnung (10) definiert, und wobei der Beutel versehen ist mit (a) einer flexiblen, Dampf-undurchlässigen röhrenförmigen inneren Folie (12), die sich von der Öffnung (10) her erstreckt und ein Austragsende (16) aufweist, und (b) einer röhrenförmigen äußeren Folie (18), die die innere Folie (12) umschließt, dadurch gekennzeichnet, daß das obere Ende (14) der inneren Folie (12) auf solche Weise an den Beutel (2) angesiegelt ist, daß der inneren Folie (12) eine geschlossene Konfiguration verliehen wird, daß die röhrenförmige äußere Folie (18) Dampf-undurchlässig ist und in einem geschlossenen Ende (22) endet; daß das obere Ende (20) der äußeren Folie (18) in der Nähe der Öffnung (10) oder des unteren Teils des Beutelnkörpers an die innere Folie (12) angesiegelt ist; und daß die innere Folie (12) durch ein lösbares Sicherungsmittel (46) in der Nähe der Öffnung (10) gesichert ist, um den Austrag von Materialien aus dieser Öffnung (10) zu verhindern, wodurch, wenn die innere Folie (12) in einer Empfangsvorrichtung positioniert ist und das terminale Ende (22) der äußeren Folie (18) offen ist und um die Empfangsvorrichtung positioniert und daran sicher befestigt ist, das Lösen des Sicherungsmittels den Austrag des Materials in die Empfangsvorrichtung ohne Kontaminierung des Materials erlaubt.
9. Beutel nach Anspruch 8, bei dem der Beutel (2) aus Hochdruck-Polyethylen niedriger Dichte oder Ethylen-Vinylacetat-Copolymeren oder Polyethylen mittlerer oder hoher Dichte oder Polypropylen oder Polybuten-1 oder Mischungen davon hergestellt ist.
10. Beutel nach Anspruch 8 oder 9, in welchem das lösbare Sicherungsmittel (46) eine Knoten-Schnur ist.
11. Beutel nach irgendeinem der Ansprüche 8 - 10, in welchem die Verschlusvorrichtung zur

Bereitstellung des geschlossenen Endes (22) der äußeren Folie (18) eine Stoß-Schnur ist.

12. Beutel nach irgendeinem der Ansprüche 8 - 11, in welchem die innere Folie (12) und die äußere Folie (18) während des Transports und der Lagerung in die Öffnung (10) hineingebauscht sind.

Revendications

1. Ensemble d'emballage pour réaliser un stockage ultrapropre et un déchargement par gravité de matières contaminables en poudre ou en granules, qui comporte (i) un conteneur extérieur (36) logeant (ii) un sac stérile (2) imperméable aux vapeurs ayant un corps de sac et une entrée (4) et une sortie (8), ladite entrée (4) et ladite sortie (8) étant fermées lorsque ledit sac (2) contient ladite matière afin d'empêcher une contamination de ladite matière et ladite sortie (8) définissant une ouverture (10), (iii) une chemise extérieure tissée (30) entourant et renfermant complètement ledit sac (2) et (iv) un revêtement (34) à feuille extérieure imperméable aux vapeurs renfermant ledit sac (2) et ledit revêtement extérieur tissé (30), ledit ensemble d'emballage comprenant aussi (v) une feuille intérieure tubulaire flexible (12) imperméable aux vapeurs, s'étendant depuis ladite ouverture (10) et ayant une extrémité de décharge (16), et (vi) une feuille extérieure tubulaire (18) enveloppant ladite feuille intérieure (12), caractérisé en ce que l'extrémité supérieure (14) de ladite feuille intérieure (12) est scellée au sac (2) d'une manière telle qu'elle confère une configuration fermée à ladite feuille intérieure (12), en ce que la feuille extérieure tubulaire (18) est imperméable aux vapeurs et se termine par une extrémité fermée (22), en ce que l'extrémité supérieure (20) de ladite feuille extérieure (18) est scellée à la feuille intérieure (12) à proximité de l'ouverture (10) ou à la partie inférieure du corps du sac ; et en ce que ladite feuille intérieure (12) est fixée par un moyen (46) de fixation libérable à proximité de ladite ouverture (10) pour empêcher le déchargement des matières de ladite ouverture (10) grâce à quoi, lorsque ladite feuille intérieure (12) est positionnée dans un moyen de réception et que ladite extrémité terminale (22) de ladite feuille extérieure (18) est ouverte et positionnée autour dudit moyen de réception et y est fixée, une libération dudit moyen de fixation permet de décharger ladite matière dans ledit moyen de réception sans contamination de ladite matière.

2. Ensemble d'emballage selon la revendication 1, dans lequel ledit sac (2) est fabriqué en polyéthylène à haute pression et basse densité, en des copolymères d'éthylène et d'acétate de vinyle, en polyéthylène de moyenne ou de haute densité, en polypropylène, en polybutène-1 ou en des mélanges de ceux-ci. 5
3. Ensemble d'emballage selon l'une quelconque des revendications 1-2 dans lequel lesdits moyens de fixation libérable (46) comprennent une cordelette à nouer. 10
4. Ensemble d'emballage selon l'une quelconque des revendications 1-3, dans lequel les moyens de fermeture pour réaliser l'extrémité fermée (22) de la feuille extérieure (18) comprennent un cordon de choc. 15
5. Ensemble d'emballage selon l'une quelconque des revendications 1-4, dans lequel ladite feuille intérieure (12) et ladite feuille extérieure (18) sont rentrées dans ladite ouverture (10) pendant l'expédition et le stockage. 20
6. Ensemble d'emballage selon l'une quelconque des revendications 1-5, dans lequel ladite chemise extérieure tissée (30) comprend une partie de fond ayant des pétales (32) de fermeture définissant une ouverture d'accès, lesdits pétales (32) de fermeture étant pliés à l'écart de ladite partie de fond pour ménager une ouverture d'accès correspondant sensiblement à ladite ouverture (10). 25
7. Ensemble d'emballage selon la revendication 6, dans lequel ladite feuille intérieure (12) et ladite feuille extérieure (18) sont rentrées dans ladite ouverture d'accès pendant l'expédition et le stockage dudit ensemble d'emballage. 30
8. Sac (2) imperméable aux vapeurs pour réaliser un stockage ultrapropre et un déchargement par gravité de matières contaminables en poudre ou en granules, qui comporte un corps de sac, une entrée (4) et une sortie (8), ladite entrée et ladite sortie étant fermées lorsque ledit sac contient ladite matière afin d'empêcher une contamination de ladite matière, et ladite sortie (8) définissant une ouverture (10), et ledit sac étant pourvu (a) d'une feuille intérieure tubulaire flexible (12) imperméable aux vapeurs s'étendant depuis ladite ouverture (10) et ayant une extrémité de décharge (16) et (b) d'une feuille extérieure tubulaire (18) enveloppant ladite feuille intérieure (12), caractérisé en ce que l'extrémité supérieure (14) de ladite feuille intérieure (12) est scellée au sac (2) d'une manière conférant une configuration fermée à ladite feuille intérieure (12), en ce que la feuille extérieure tubulaire (18) est imperméable aux vapeurs et se termine par une extrémité fermée (22), en ce que l'extrémité supérieure (20) de ladite feuille extérieure (18) est scellée à la feuille intérieure (12) à proximité de l'ouverture (10) ou à la partie inférieure du corps du sac ; et en ce que ladite feuille intérieure (12) est fixée par un moyen de fixation libérable (46) à proximité de ladite ouverture (10) afin d'empêcher le déchargement des matières depuis ladite ouverture (10), grâce à quoi, lorsque ladite feuille intérieure (12) est positionnée dans un moyen de réception et que ladite extrémité terminale (22) de ladite feuille extérieure (18) est ouverte et positionnée autour desdits moyens de réception et fixée à ceux-ci, la libération dudit moyen de fixation permet un déchargement de ladite matière dans ledit moyen de réception sans contamination de ladite matière. 35
9. Sac selon la revendication 8, dans lequel ledit sac (2) est fabriqué en polyéthylène à haute pression, basse densité, en copolymères d'éthylène et d'acétate de vinyle, en polyéthylène de moyenne et de haute densité, en polypropylène, en polybutène-1 ou en mélanges de ceux-ci. 40
10. Sac selon la revendication 8 ou 9, dans lequel ledit moyen de fixation libérable (46) est une cordelette à nouer. 45
11. Sac selon l'une quelconque des revendications 8-10, dans lequel le moyen de fermeture pour réaliser l'extrémité fermée (22) de la feuille extérieure (18) et un cordon de choc. 50
12. Sac selon l'une quelconque des revendications 8-11, dans lequel ladite feuille intérieure (12) et ladite feuille extérieure (18) sont rentrées dans ladite ouverture (10) pendant l'expédition et le stockage. 55
