

NEEDLE DEVICE

ABSTRACT

5 A needle device (1) is configured such that a needle unit (10) can be retracted into and
contained in a protector (50) from a hub (15) side of the needle unit (10). In a state in which a
cover (30) is not attached to the needle unit (10), once the needle unit (10) is contained in the
protector (50), a locking claw (55) provided on the protector (50) engages with the hub (15) so that
the needle unit (10) cannot be separated from the protector (50). In a state in which the cover
10 (30) is attached to the needle unit (10), the needle unit (10) can be inserted into and removed
from the protector (50).
