ABSTRACT

PROCESS SYSTEM MANAGEMENT SYSTEM, SERVER DEVICE, MANAGEMENT PROGRAM, AND MANAGEMENT METHOD

A management system includes a map information storage unit, an association information storage unit, a map information generation unit, a display unit, and an operation unit. The map information generation unit generates display arrangement map information and display process map information for displaying an arrangement map that indicates arrangement positions and a process map that indicates a connection relationship of a plurality of system configuration devices that constitute a process system. Also, the map information generation unit generates the display process map information in a display mode that enables other system configuration devices associated with a designated system configuration device to be identified, based on information stored in the association information storage unit.
