

TITLE OF THE INVENTION:
DISPLAY PANEL AND FABRICATION METHOD THEREOF

ABSTRACT

5

Disclosed is a display panel including a substrate, multiple first bonding pads, multiple repair pads, a pixel array, multiple first data lines, multiple transfer lines, multiple repair signal lines, and an isolation layer. The substrate has a bonding pad area, a repair area, and a pixel array area. The repair area is located between the bonding pad area and the pixel array area. The first data lines extend from the bonding pad area to the pixel array area, and the first data lines electrically connect the first bonding pads to the pixel array respectively. The transfer lines are located over the repair area and across the first data lines. The repair signal lines extend from the bonding pad area to the repair area and are electrically connected to the repair pads respectively. The isolation layer is located between the transfer lines and the repair signal lines.
