ABSTRACT OF THE DISCLOSURE

CABLE PROTECTIVE SHIELD ASSEMBLY

A cable protective shield assembly 10 is provided for managing the position of computer cables. The assembly comprises a base plate 11 having a number of spacers 16 formed on one surface, a cover plate 12 having a number of bores 20 extending through the plate 12 at locations designated in alignment with the spacers 16 of the base plate, and a corresponding number of fasteners 13 for insertion through the bores 20 of the cover plate 12 into the spacers 16 of the base plate 11 to rigidly couple the plates together. The height of the spacers 16 create a standoff distance between the base plate 11 and cover plate 12 defining a space for computer cables to extend. The spacers 16 are also positioned across the base plate surface as to create specific passageways for the cables to be located. One or more ports 21 can be placed along the perimeter 24 of the cover plate 12 to allow access to cable connectors while generally maintaining the organized position of the cables. The assembly 10 shields the cables from electromagnetic energy and filters noise superimposed on the cables by electromagnetic energy present in the chassis.
