COPY**Stabilized flexible PVC**

The invention relates to a flexible PVC (polyvinyl chloride) which has been stabilized by epoxide compounds and perchlorates, to a process for its preparation, and to its use.

PVC can be stabilized by a number of additives. Heavy-metal compounds of lead and cadmium are particularly suitable for this purpose, but are controversial today for ecological reasons due to the heavy-metal content (cf. "Plastics Additives", Editors R. Gächter and H. Müller, Hanser Verlag, Munich, Vienna, New York, 3rd Edition, 1990, pages 287-295, and "Kunststoff-Handbuch PVC" [Plastics Handbook PVC], Volumes 1 and 2, Beck/Braun, Carl Hanser Verlag, Munich).

The search therefore continues for effective stabilizers and stabilizer combinations.

Epoxide compounds have been known for some time as costabilizers for PVC. Epoxidized soybean oil is frequently used (cf., for example, "Plastics Additives", Editors R. Gächter and H. Müller, Hanser Verlag, 3rd Edition, 1990, pages 303-4, and US 3 928 267). For chlorinated polyvinyl chloride, the use of glycidyl ethers of novolak resins as stabilizer has also been described, for example in DE 3 402 408.

JP Hei 3122149 proposes a rigid PVC composition comprising solid epoxides and perchlorates.

It has now been found that flexible PVC stabilized by means of a mixture of a perchlorate and a terminal epoxide has excellent thermal stability with a good initial colour and good colour retention. Surprisingly, the flexible PVC stabilized in accordance with the invention meets the high demands made, for example, of PVC stabilized by means of barium/zinc compounds. Particular mention should be made of the excellent shelf life and light stability that are achieved. Furthermore, good stabilization is achieved irrespective of the state of aggregation of the epoxide, i.e. liquid terminal epoxides can also be employed without disadvantage.

The invention therefore relates to a composition comprising

- (a) flexible PVC,
- (b) perchloric acid or a perchlorate and
- (c) a terminal epoxide compound.

This Sheet Has Been Replaced

The composition preferably contains no compounds of lead or cadmium.

For the purposes of the present invention, flexible PVC denotes PVC mixtures comprising a proportion of at least one plasticizer sufficient to achieve the properties of flexible PVC.

PVC having a glass transition temperature of above 70°C is not regarded as flexible PVC for the purposes of this invention.

Flexible PVC is furthermore defined by its suitability, owing to its plasticizer content, for the production of flexible PVC articles. These include, for example, cable and wire sheaths, roof membranes, decoration sheeting, foams, agricultural sheeting, office films, automotive sheeting (also polyurethane foam-backed), tubes, sealing profiles and the like.

Component (a) in the novel compositions can also be blends, copolymers or graft polymers of PVC with polymerizable compounds, such as acrylonitrile, vinyl acetate or (co)polymers such as ABS, where suspension, bulk or emulsion polymers and mixtures thereof are possible. Examples of such components (a) are compositions comprising (i) 20-80 parts by weight of a vinyl chloride homopolymer (PVC) and (ii) 80-20 parts by weight of at least one thermoplastic copolymer based on styrene and acrylonitrile, in particular from the group consisting of ABS, NBR, NAR, SAN and EVA. The abbreviations used for the copolymers are known to the person skilled in the art and have the following meanings: ABS = acrylonitrile-butadiene-styrene; SAN = styrene-acrylonitrile; NBR = acrylonitrile-butadiene; NAR = acrylonitrile-acrylate; EVA = ethylene-vinyl acetate. Also suitable are, in particular, acrylate-based styrene-acrylonitrile copolymers (ASA). In this connection, component (a) is preferably a polymer composition comprising, as components (i) and (ii), a mixture of 25-75 % by weight of PVC and 75-25 % by weight of said copolymers. Examples of such compositions are: 25-50 % by weight of PVC and 75-50 % by weight of copolymers or 40-75 % by weight of PVC and 60-25 % by weight of copolymers. Preferred copolymers are ABS, SAN and modified EVA, in particular ABS. NBR, NAR and EVA are also particularly suitable. The novel composition can comprise one or more of said copolymers. Of particular importance as component (a) are compositions comprising (i) 100 parts by weight of PVC and (ii) 0-300 parts by weight of ABS and/or SAN-modified ABS and 0-80 parts by weight of the copolymers NBR, NAR and/or EVA, but in particular EVA, and, per 100 parts by weight of (i) and (ii), 5-120 parts by weight of plasticizers, in particular phthalates, especially DOP, DINP and DIDP, and/or trimellitates, especially TOTM, TIDTM and TITDTM [cf. below under A) and C)].

A definition of these plasticizers and examples thereof are given in "Plastics Additives", edited by R. Gächter and H. Müller, Hanser Verlag, 1990, page 393, chapter 5.9.6, and in "PVC Technology", edited by W.V. Titow, 4th Ed., Elsevier Publ., 1984, pages 165-170.

The most usual starting materials for the preparation of polyester plasticizers are: dicarboxylic acids, such as adipic, phthalic, azelaic and sebacic acids; diols, such as 1,2-propanediol, 1,3-butanediol, 1,4-butanediol, 1,6-hexanediol, neopentyl glycol and diethylene glycol; monocarboxylic acids, such as acetic, caproic, caprylic, lauric, myristic, palmitic, stearic, pelargonic and benzoic acids; monofunctional alcohols, such as isooctanol, 2-ethylhexanol, isodecanol and C₇-C₉alkanol and C₉-C₁₁alkanol mixtures. Particularly advantageous are polyester plasticizers made from said dicarboxylic acids and monofunctional alcohols.

J) Glycol esters, for example diglycol benzoates.

Definitions and examples of plasticizers from groups G) to J) are given in the following handbooks:

"Plastics Additives", edited by R. Gächter and H. Müller, Hanser Verlag, 1990, page 284, chapter 5.9.14.2 (Group G)) and chapter 5.9.14.1 (Group H)).

171-173, chapter 6.10.2 (Group G)), page 174, chapter 6.10.5 (group H)), page 173, chapter 6.10.3 (group I)) and pages 173-174, chapter 6.10.4 (group J)).

Particular preference is given to plasticizers from groups A) to G), in particular A) to F), especially the plasticizers in these groups which have been mentioned as preferred.

In general, from 5 to 120 parts, in particular from 10 to 100 parts, of the plasticizers from groups A), B), C) and E), from 0.5 to 30 parts, in particular from 0.5 to 20 parts, of those from group D) and from 1 to 100 parts, in particular from 2 to 80 parts, of those from groups F) and G) are present. It is also possible to use mixtures of different plasticizers.

The plasticizers can be used in a total amount of, for example, from 5 to 120 parts by weight, preferably from 10 to 100 parts by weight, in particular from 20 to 70 parts by weight, based on 100 parts by weight of PVC.

Perchloric acid or the particular perchlorate can be employed in various customary forms, for example as a salt or an aqueous solution coated onto a support material, such as PVC, calcium silicate, zeolites or hydrotalcites, or bonded into a hydrotalcite by chemical reaction.

They can be used in an amount of, for example, from 0.001 to 5 parts by weight, preferably from 0.01 to 3 parts by weight, particularly preferably from 0.01 to 2.0 parts by weight, based on 100 parts by weight of PVC.

The terminal epoxide compounds (c) which can be used for the purposes of the invention can have an aliphatic, aromatic, cycloaliphatic, araliphatic or heterocyclic structure; they contain epoxide groups as side groups. The epoxide groups are preferably bonded to the remainder of the molecule as glycidyl groups via ether or ester bonds, or they are N-glycidyl derivatives of heterocyclic amines, amides or imides. Epoxide compounds of these types are known in general terms and are commercially available.

The epoxide compounds contain at least one epoxide radical of the formula

Examples:

A flexible PVC composition is prepared by mixing the individual components as shown in the tables below (amounts in parts by weight).

The constituents are homogenized for 5 minutes in mixing rolls at 170°C giving a film with a thickness of 0.3-0.5 mm.

The long-term stability is determined by a static heat test ("stat.h.") in accordance with DIN 53381, in which the sample is stored in a test oven at 190°C and the time taken for the sample to blacken is determined.

A further determination of the long-term stability ("VDE test") is carried out by determining the thermal stability in accordance with DIN VDE 0472. In this test, the sample is warmed in a glass tube sealed at the bottom (AR glass from Peco-Laborbedarf GmbH, Darmstadt) in an oil bath at 200°C, and the time taken for a visible red coloration (corresponding to a pH of 3) to appear on the universal indicator paper is determined.

A further determination of the stability of the PVC is carried out by the dehydrochlorination test ("DHC test"), carried out in accordance with DIN 53381, sheet 3. In this test, the time taken for the dehydrochlorination curve to rise is measured at the temperature shown in each case.

Long-term oven storage test:

Pressed PVC sheets measuring 10x10x2 mm are produced and then stored in an oven at from 100 +/- 0.5°C for a defined time (3, 7 or 14 days). The samples are then subjected to the dehydrochlorination test described above.

Long-term milling test.

The PVC mixture is milled at a temperature of 180°C in a mill with a nip width of 0.5 mm, and a sample is taken every 5 minutes and cooled, and its yellowness index (YI) is measured.
